

*PICES/GLOBEC Symposium*

Honolulu, Hawaii

April 19-21, 2006

**Spatial dynamics of small pelagic fish in the California  
Current system on the regime time-scale. Parallel  
processes in other species-ecosystems.**

Ruben Rodríguez-Sanchez and Daniel Lluch-Belda

CICIMAR-IPN

La Paz, B.C.S., México

[rrodrig@ipn.mx](mailto:rrodrig@ipn.mx)

# BACKGROUND (1/3)

**What have we learned from analysis of time-series of information ? :**

- Multidecadal variation of biological and environmental indices

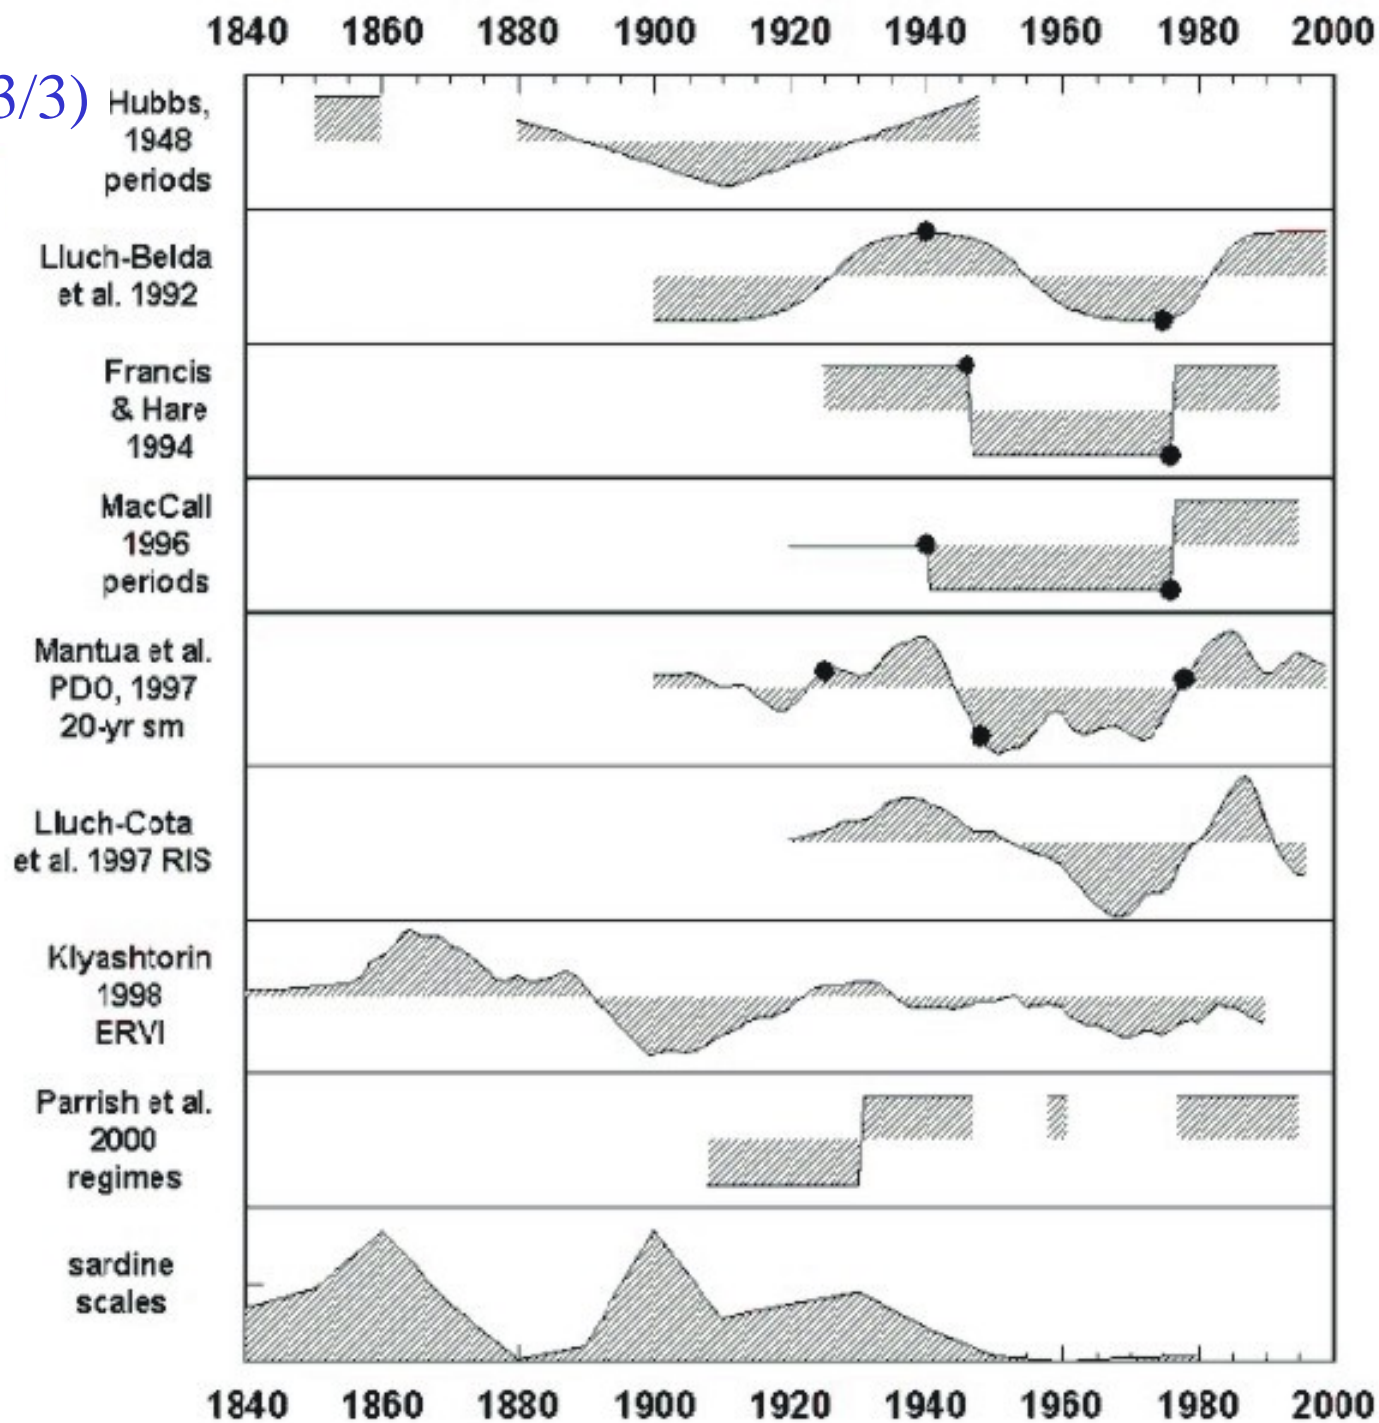

## BACKGROUND (2/3)

- sardine catch records from well separated ecosystems shown **global synchronic** : The Regime Hypothesis

## BACKGROUND (3/3)

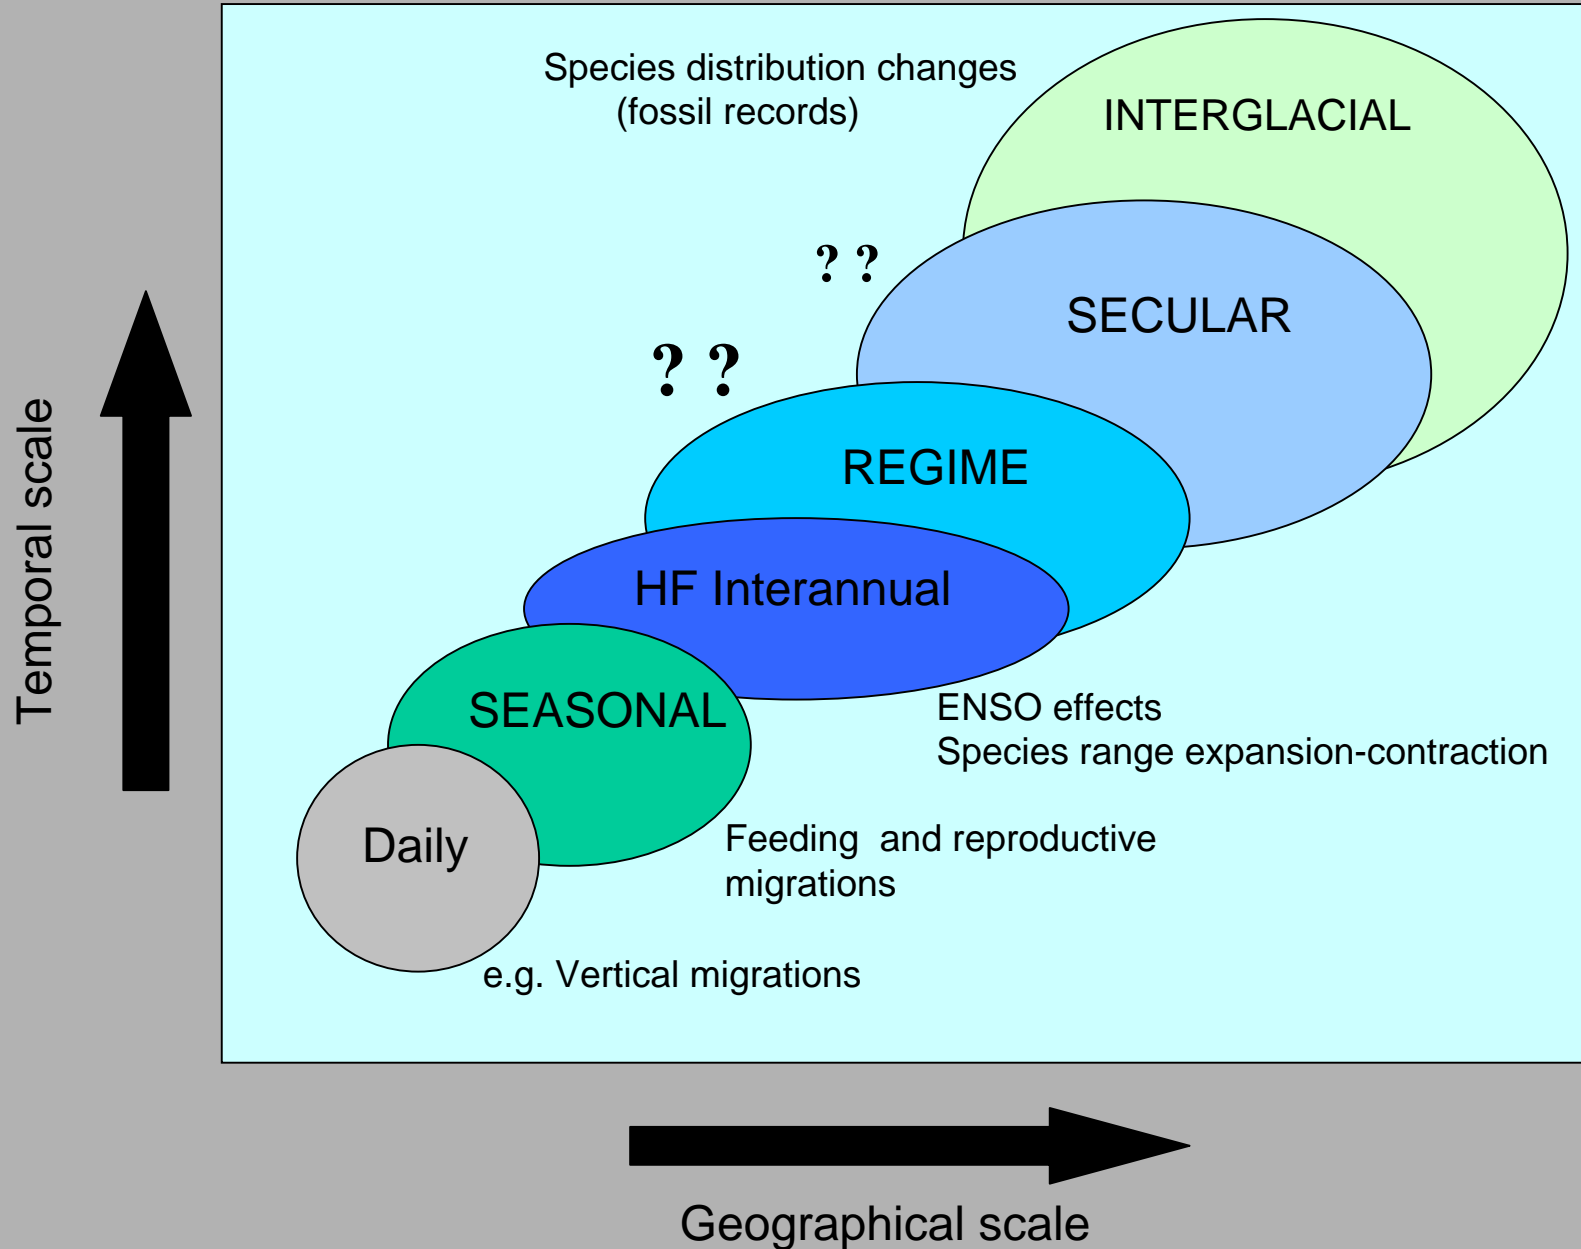

- The regime variation has been shown also for **other species-ecosystems**, or using other environmental indicators

No doubt that the **unidimensional analysis** of time-series of information has been useful to advance in the understanding of population dynamics and their relations with environmental variability.

**But ...**

# ECOLOGICAL PROCESS ON SPATIAL-TEMPORAL SCALES

# ECOLOGICAL PROCESS ON SPATIAL-TEMPORAL SCALES

## Problems for spatial analysis

e.g. Small pelagic fish in the California Current system.

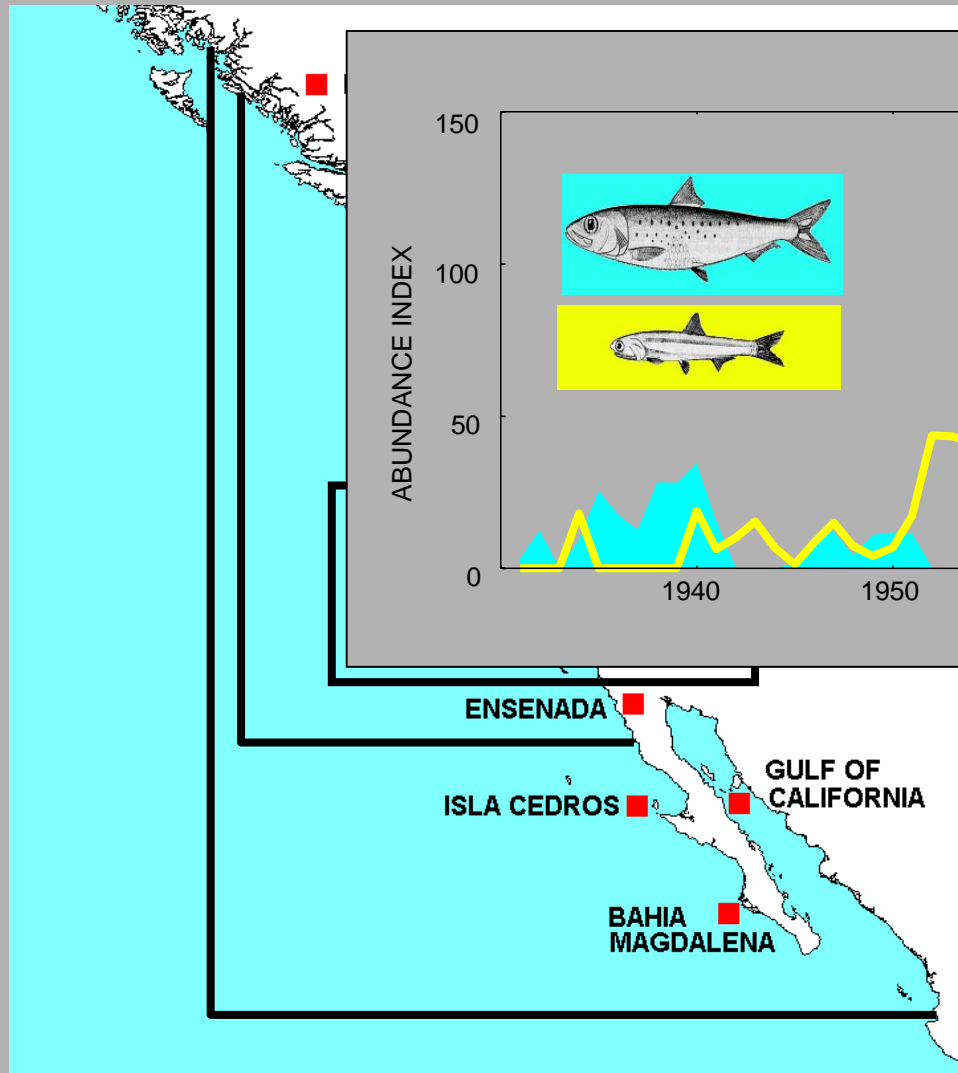

- Species with wide geographical variation
  - Transboundary distribution
- Assumptions of different populations or stocks within species distribution
  - Lecomte et al. 2004: genetic study

### Data from commercial fishing

- Relatively continuous in time for each port
- Different time-area coverage
- No comparative indices are available between ports
- Important gaps between ports

# DATA FROM COMMERCIAL FISHING

Authors have used  
different area  
coverage

**RESULTING  
DIFFERENT  
CONCLUSIONS!!**

OFF CALIFORNIA

**Analysis over time-scale only**  
as representatives of a stock variability

# OTHER ABUNDANCE INDEX

e.g. abundance of scales in a core sample of sediments

analysis over time-scale only

## Reports of range expansion-contraction

High frequency

## Reports of range expansion-contraction, no changes of abundance reported

Decadal - bidecadal

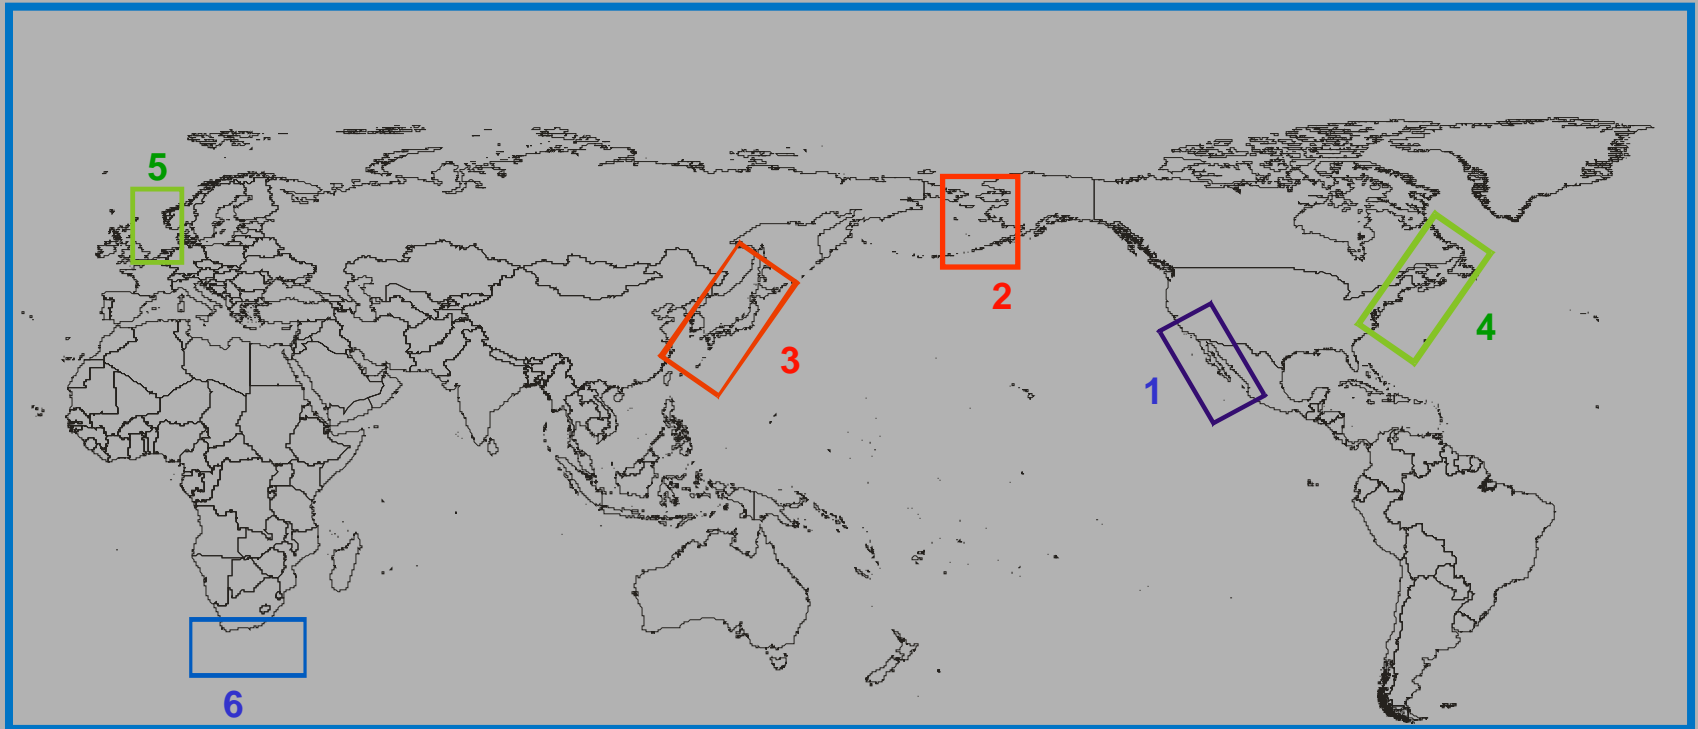

## Examples of changes in population size associated with major geographical variations in the position of the center of distribution and bulk of the biomass

Low frequency

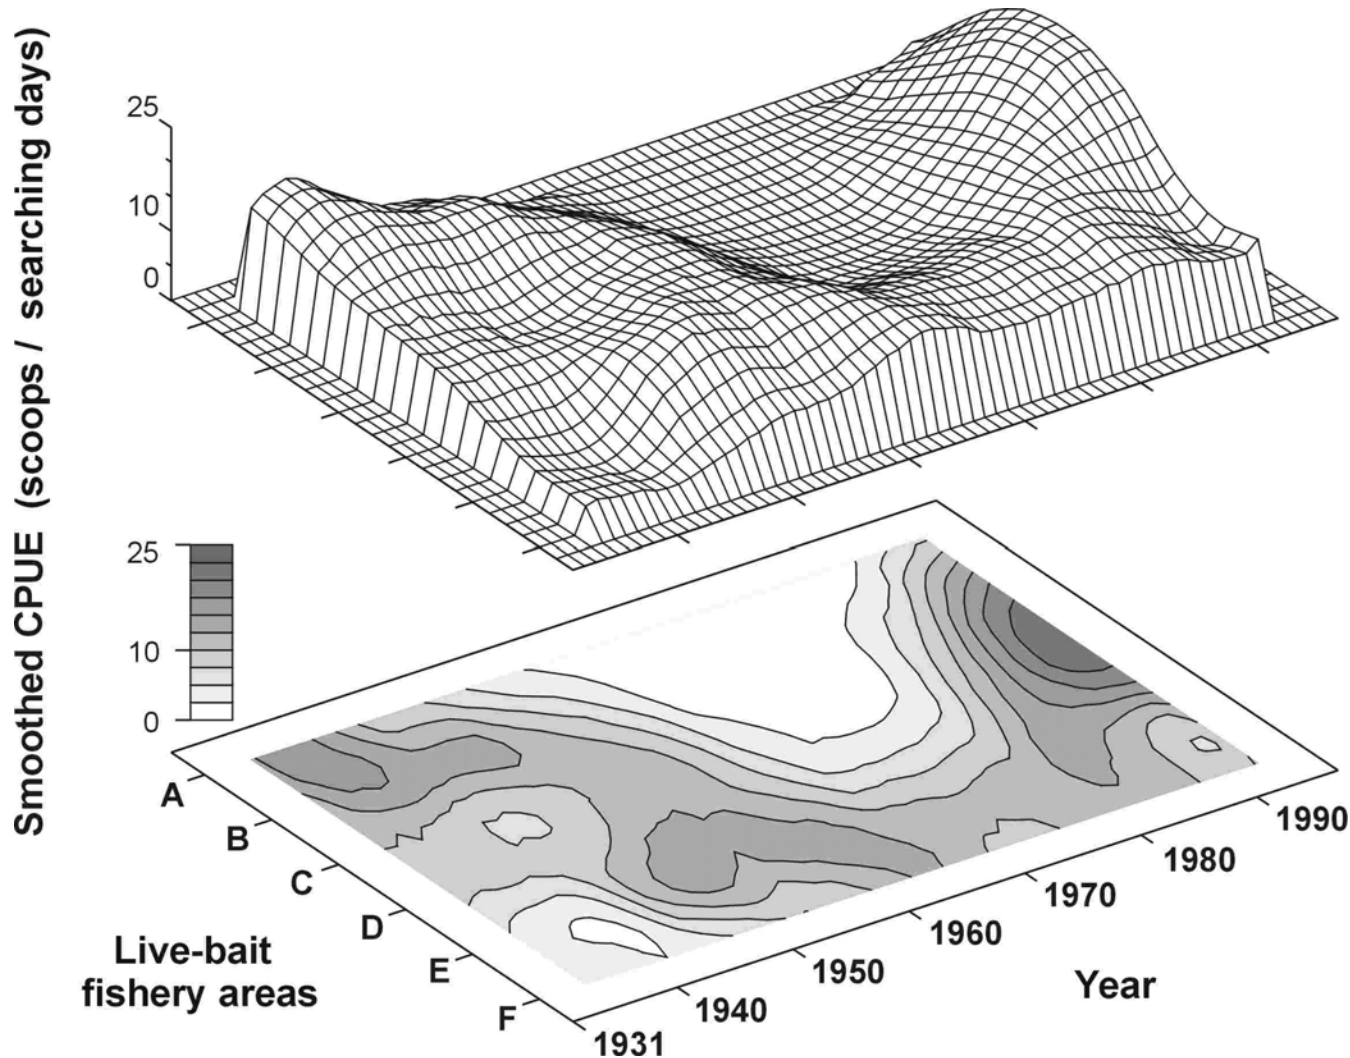

This presentation

No.	Ecosystem/ author	Species	Time frame	Regime condition
1	<b>California Current System</b> (Rodríguez-Sánchez et al 2001, 2002)	Small Pelagic Fish	1931 – 1997	Cooling and Warming conditions
2	<b>Eastern Bering Sea</b> (Zheng et al. 2001)	Snow Crab	1978 - 1999	Warming conditions
3	<b>Japan Sea</b> (Kidokoro et al. / In: Saitoh et al. 2004)	Japanese common squid	1981 - 1998	Warming conditions

5	<b>Northern Sea</b> (Perry et al. 2005)	Demersal Fish	1977 - 2001	Warming conditions
6	<b>Southern Benguela</b> (van der Lingen et al. 2005)	Benguela Sardine	1987 - 2004	Warming conditions

## Spatial variability of Pacific sardine at regime time-scale

Rodríguez-Sánchez et al. (2002)

## **The question arising is:**

Is this natural pattern of variation only recorded in the Pacific sardine?

## **In this work:**

- 1) the large-scale, long-term (1931-1997) variability of tropical species in the CCS is included in the sardine-anchovy analysis.
- 2) examples are shown for other species and communities from other ecosystems

# LIVE-BAIT FISHERY AREAS

- Annual CPUE by specie (1931-1997)

## SARDINE

*Sardinops caeruleus*

## NORTHERN ANCHOVY

*Engraulis mordax*

## TROPICAL SPECIES

*Harengula thrissina*

*Opisthonema spp.*

*Cetengraulis mysticetus*

## TIME SERIES OF SST

- From COADS database (1900-1996)  
squares of 2 X 2 degrees

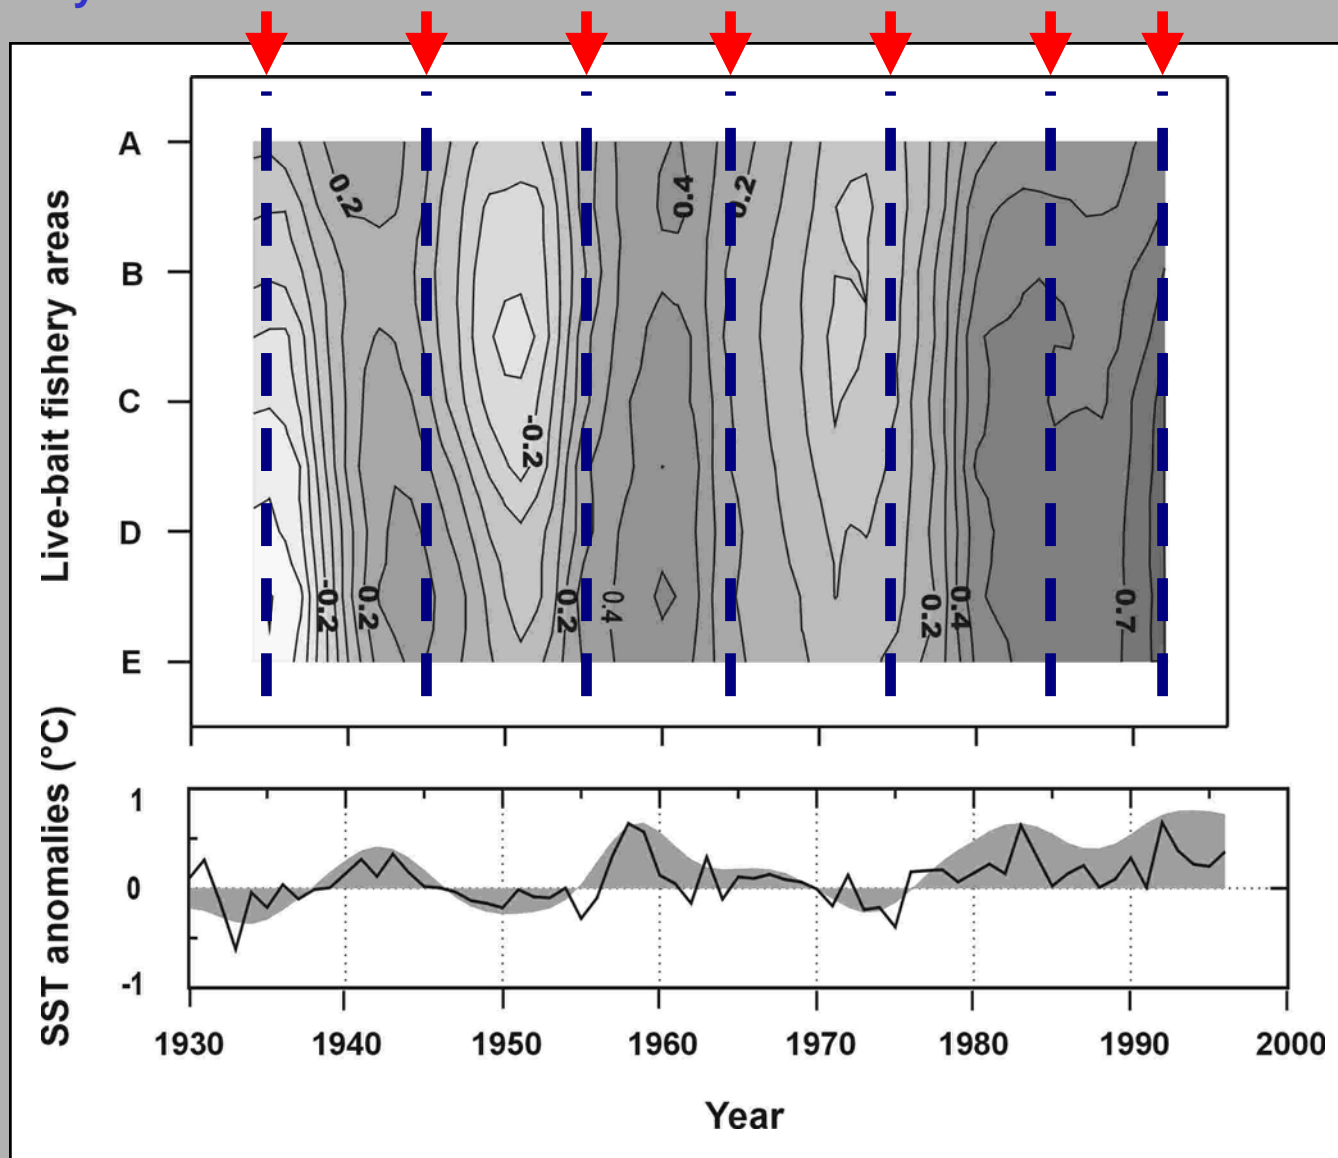

## Spatial distribution of SST anomalies

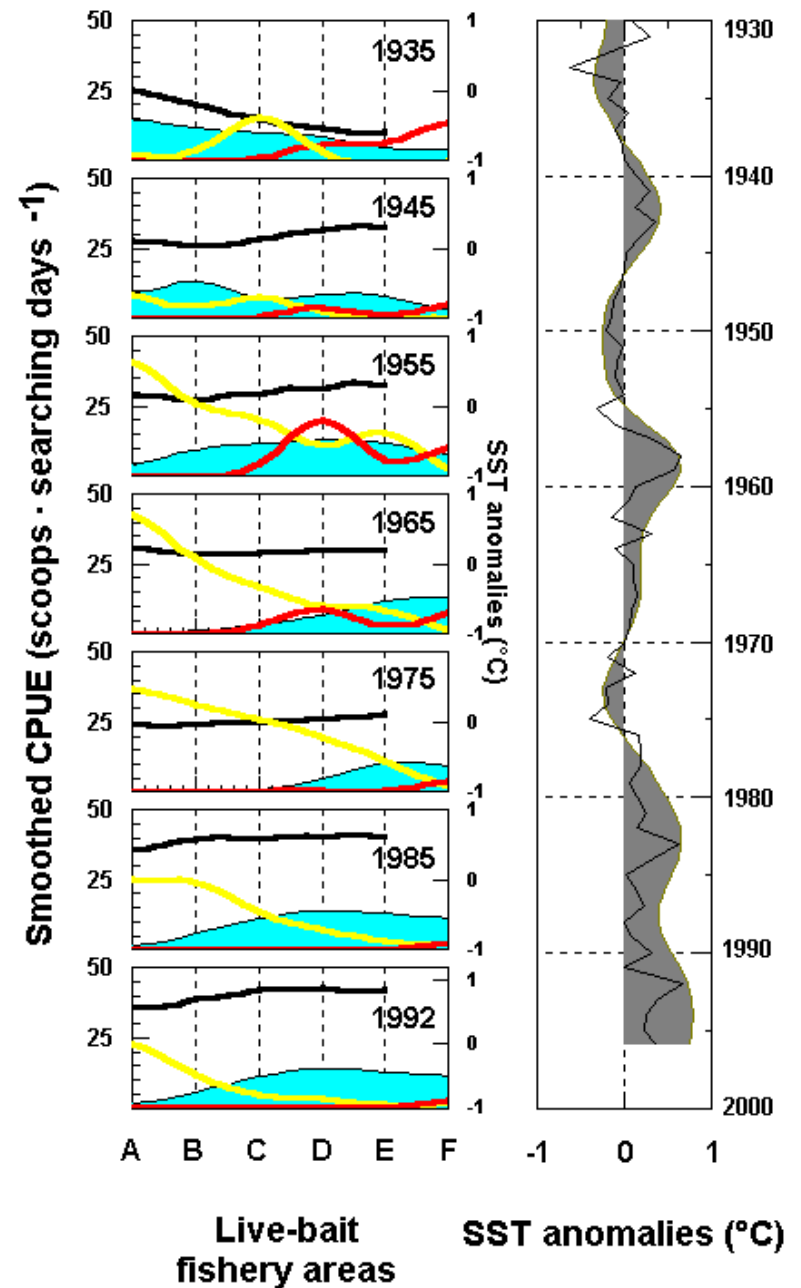

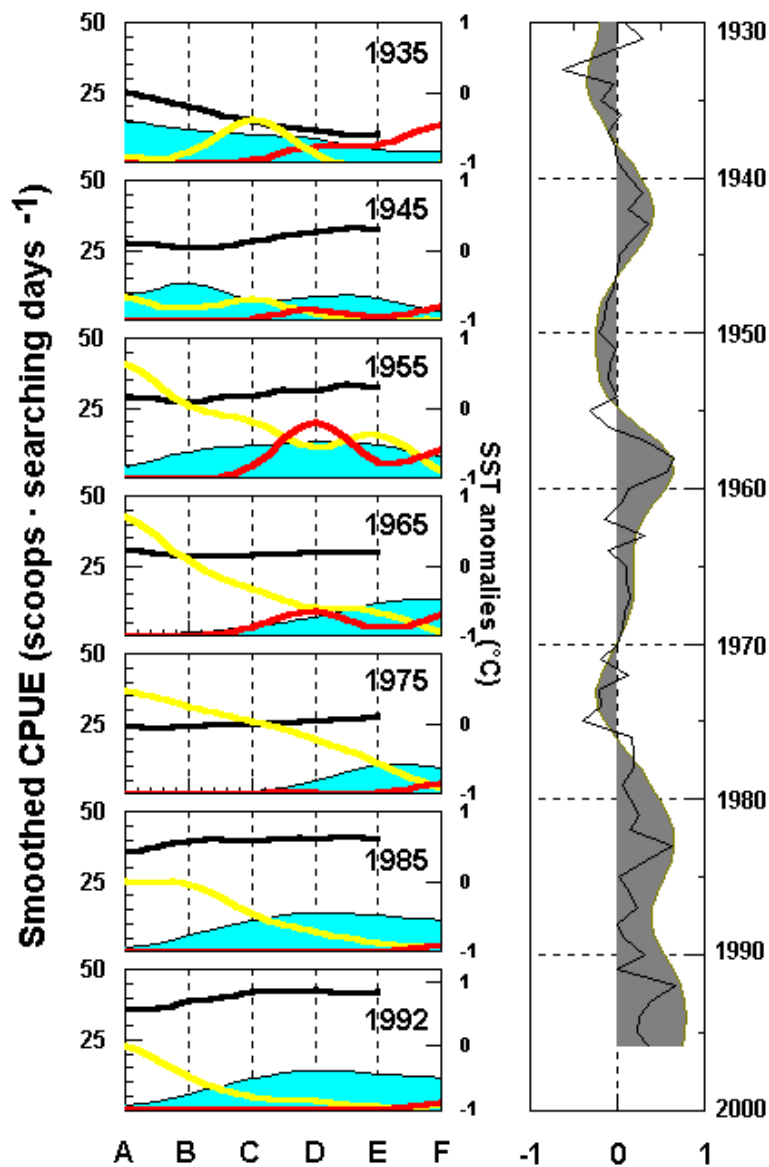

Selected years: 1935 1945 1955 1965 1975 1985 1992

LARGE-SCALE LOW-FREQUENCY  
VARIABILITY OF  
SST ANOMALIES  
AND  
SMALL PELAGIC FISH ABUNDANCE

==

“Annual slides from the cakes”

=

10-year average

# LARGE-SCALE LOW-FREQUENCY VARIABILITY OF SST ANOMALIES AND SMALL PELAGIC FISH ABUNDANCE

- During the 1940's regime shift sardine abundance declined in the northern areas as the first sign of ocean-climate and population interaction, with less apparent changes in the south.
- Changes in the southern areas were observed almost a decade later.
- After the 1970's regime shift sardine abundance changes in northern areas were observed almost a decade later than the changes in the south, when sardine population was moving its location northward.

# LARGE-SCALE LOW-FREQUENCY VARIABILITY OF SST ANOMALIES AND SMALL PELAGIC FISH ABUNDANCE

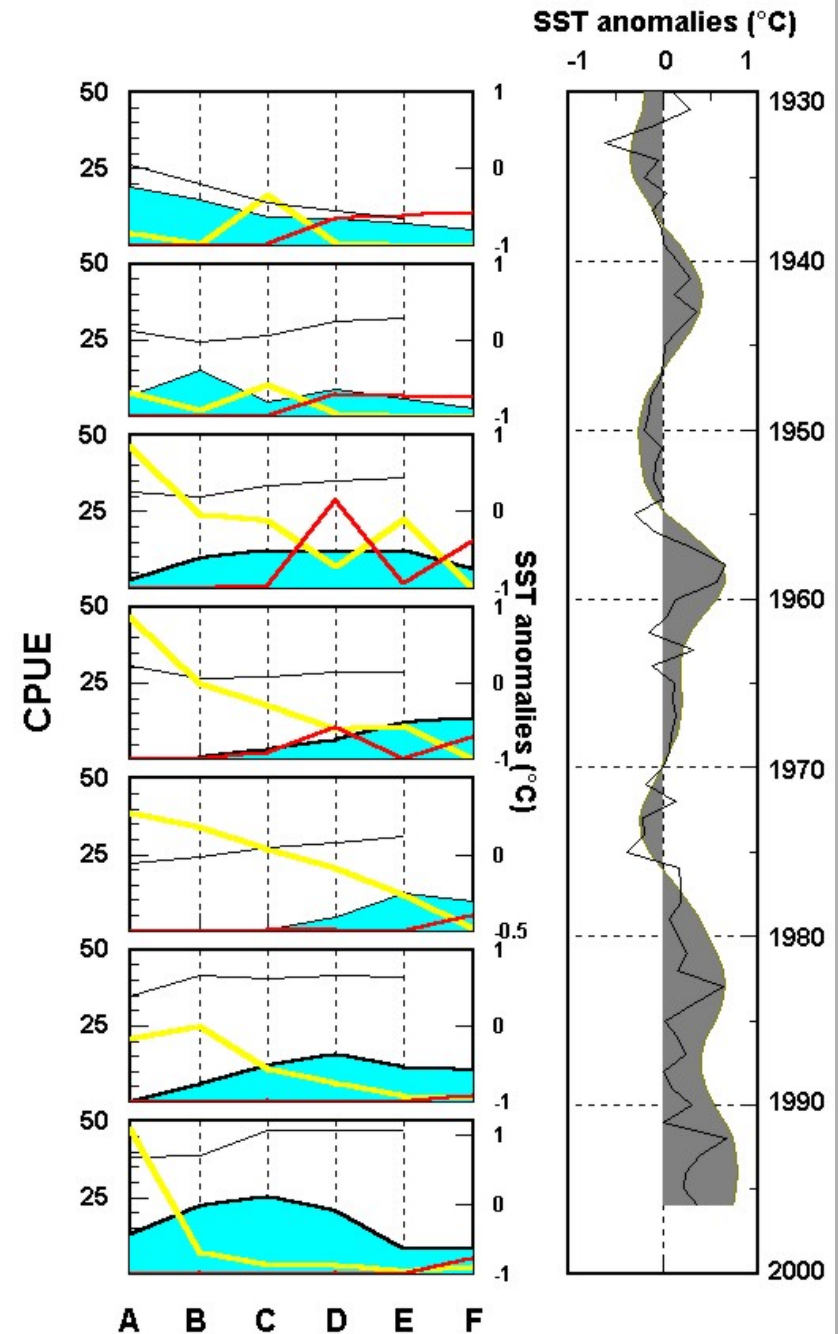

- The spatial pattern of abundance for the northern anchovy (*Engraulis mordax*) appears to be inversely related to sardine population abundance.
- Anchovies increased where and when sardines were either absent or at a low population level

# LARGE-SCALE LOW-FREQUENCY VARIABILITY OF SST ANOMALIES AND SMALL PELAGIC FISH ABUNDANCE

- Tropical species reached higher abundance levels during the 1920s-1940s warming period than those of the 1970s-1990s warming period.
- The warming phases are not of the same intensity

## For other species-ecosystems:

- The authors of the reports are explicit in suggest or conclude:

*“... climatic regime shifts appear to have forced a changing population size associated with major geographical variations in the position of the center of distribution and bulk of the biomass ...”*

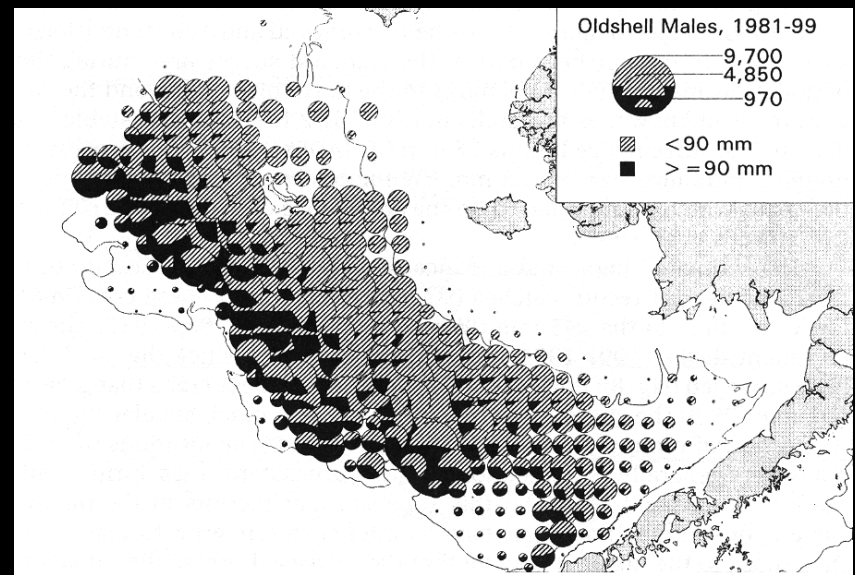

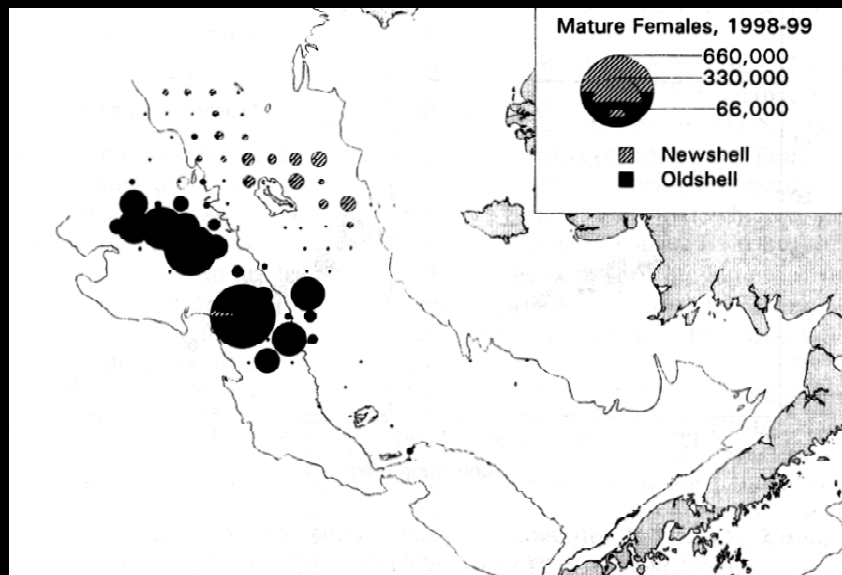

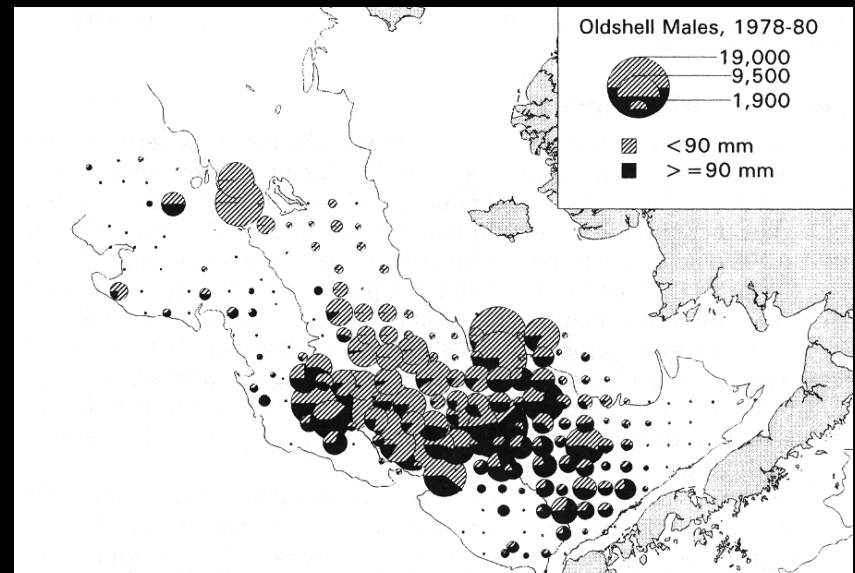

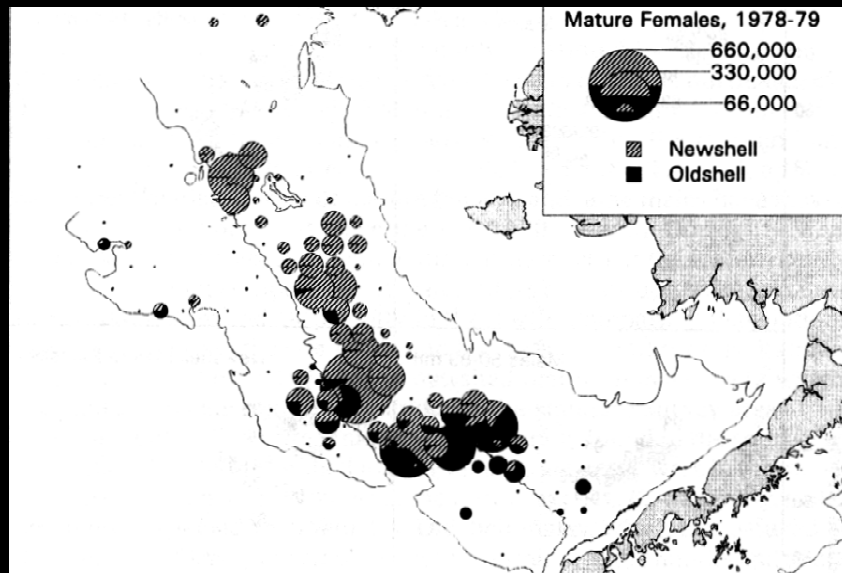

- No my interpretation of their results.

SST anomalies (°C)

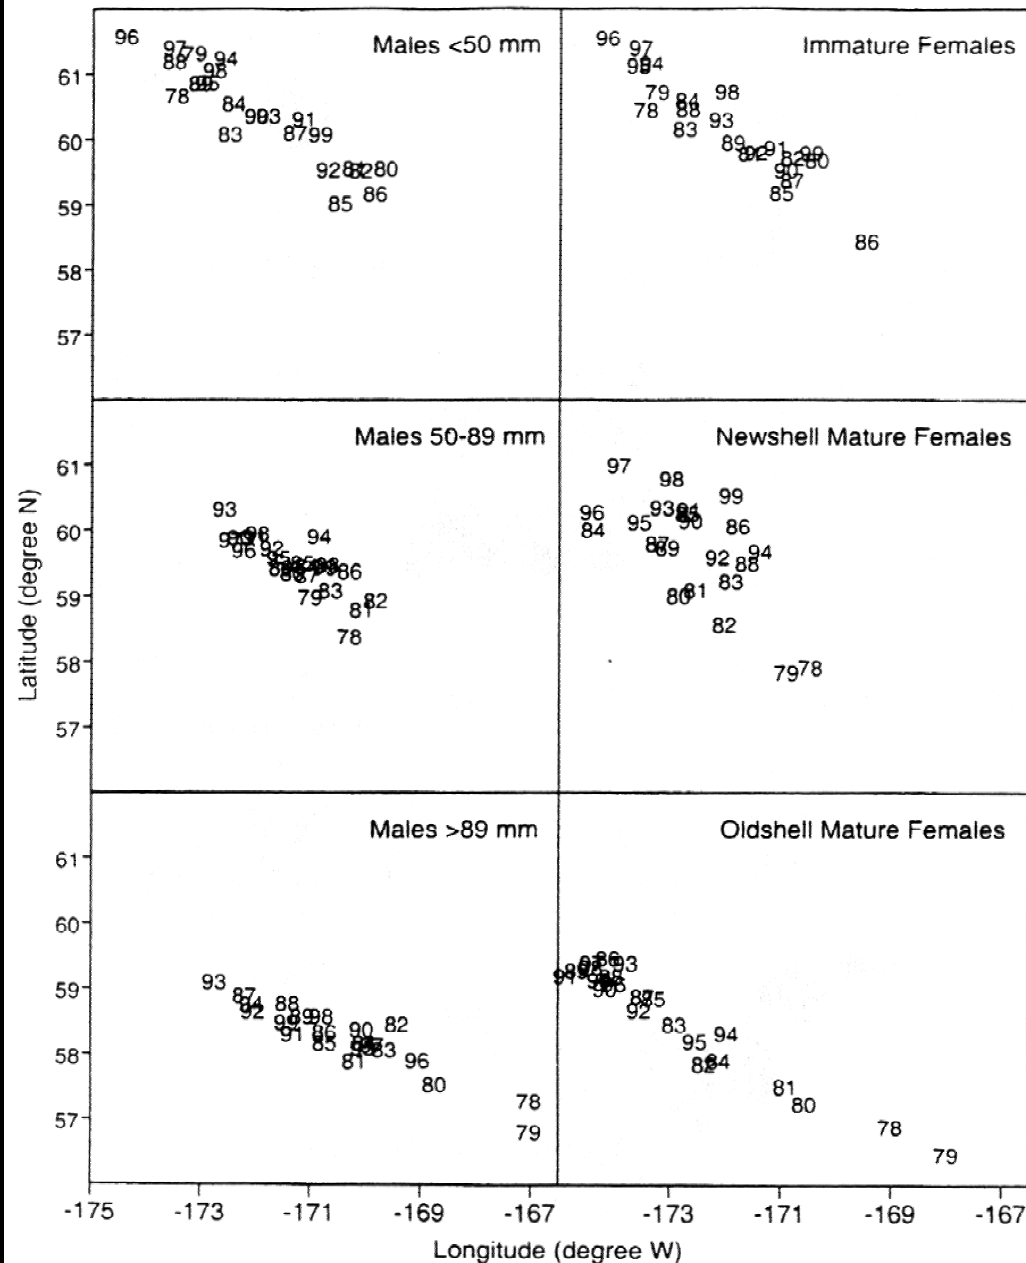

## EASTERN BERING SEA: Snow crabs (1/2)

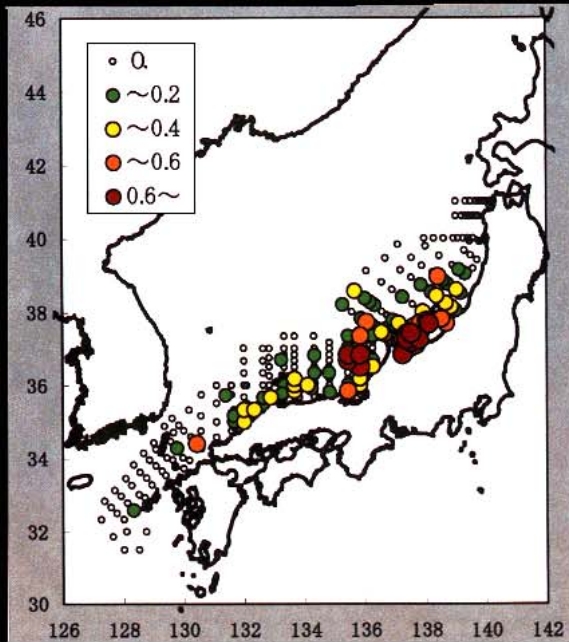

Distributions of snowcrabs in the eastern Bering Sea derived from NMFS summer trawl survey data. Density is expressed as the number of crabs per square nautical mille (from Zheng et al. 2001)

# EASTERN BERING SEA: Snow crabs (2/2)

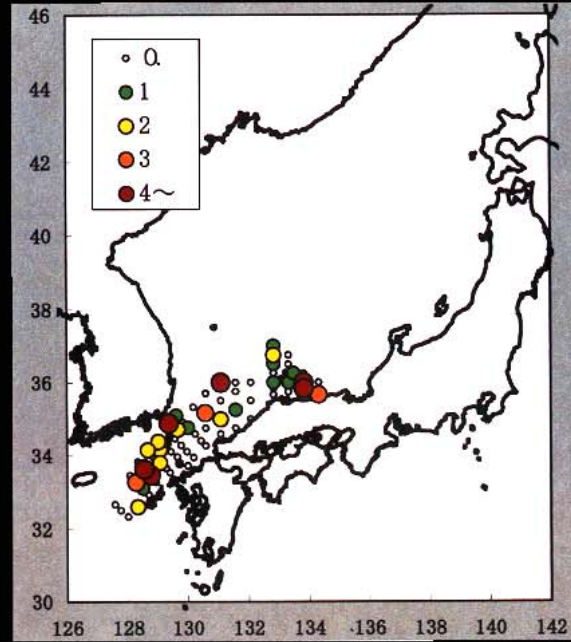

Centers of distribution of eastern Bering Sea snow crab derived from NMFS summer trawl survey data from 1978 to 1999. Years are plotted as data points (from Zheng et al. 2001)

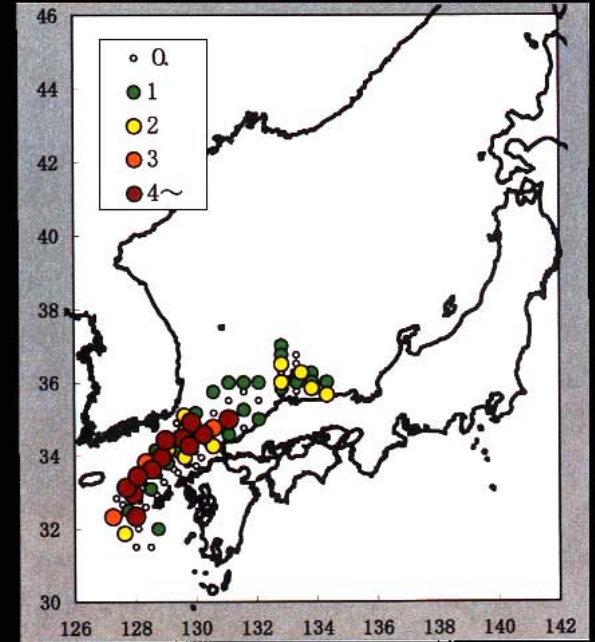

## NORTHWESTERN PACIFIC: Japanese common squid

Low stock period  
(average of 1981-1986)

High stock period (1995)

High stock period (1998)

No distribution changes  
were observed

Shift of spawning ground of Japanese common squid based on the larval distribution pattern  
(October-November) (From Kidokoro et al.)

# NORTHEASTERN ATLANTIC: continental shelf fish community (1/2)

1966-1970

1976-1980

1986-1990

1996-1999

Haddock

Atlantic herring

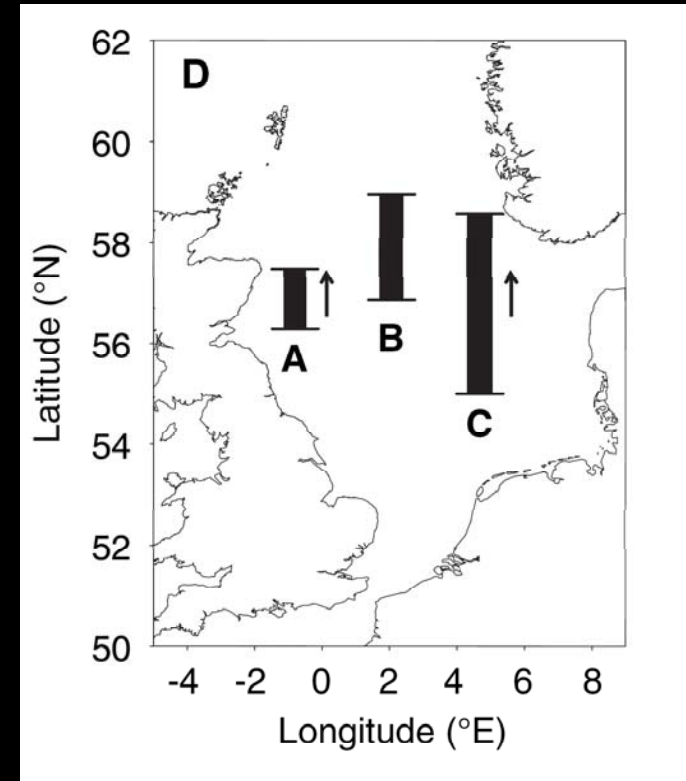

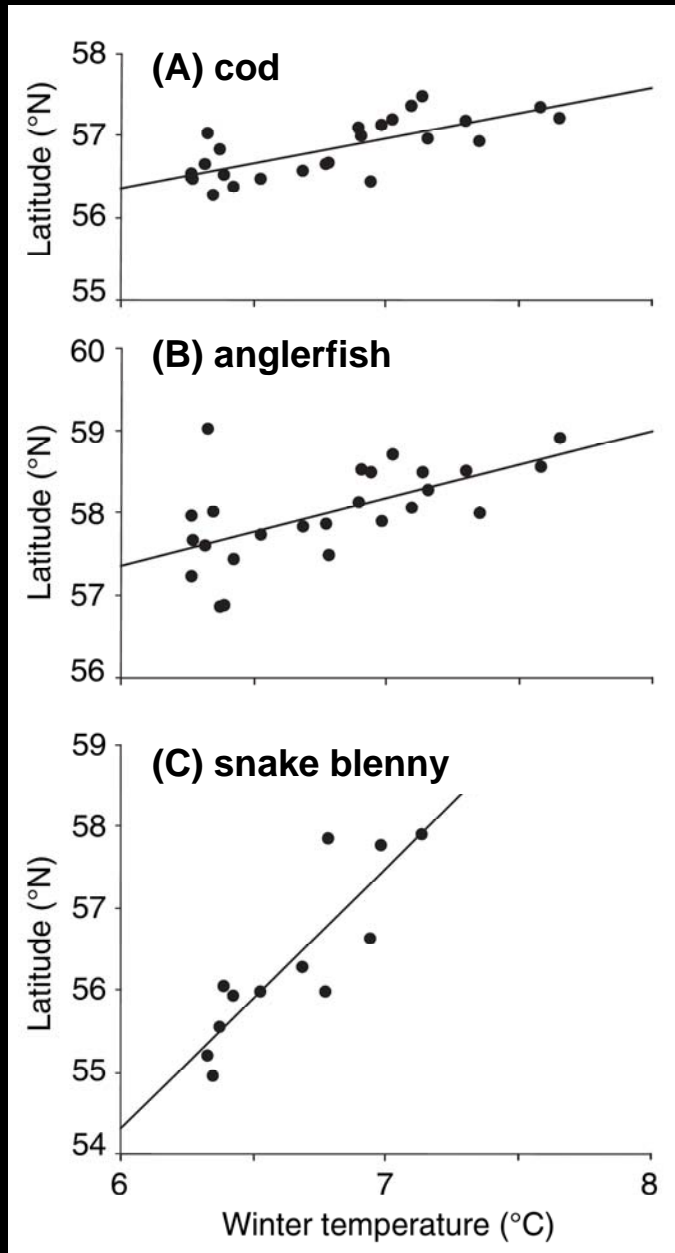

Spiny dogfish

Estimated biomass in 0.5° cells in four time blocks (from Garrison 2001)

# NORTHEASTERN ATLANTIC: continental shelf fish community (2/2)

# Northern Sea: Demersal Fish (examples of fish distributions that have shifted north with climatic warming)

Ranges of shifts in mean latitude are shown for (A), (B), and (C) within the North Sea.

- Bars illustrate only shift ranges of mean latitudes, not longitudes.
- Arrows indicate where shifts have been significant over time, with the direction of movement

Relationships between mean latitude and 5-year running mean winter bottom temperature.

Biomass of sardine as observed during annual spawner biomass surveys 1984-2004

Annual centre of gravity of sardine catches

## Possible causes of geographical shift:

### ■ Fishing pressure

#### **e.g. Pacific sardine**

- The most valuable and accessible resources were depleted first (e.g. fishery off California)
- Low harvest rate when the change of distribution occurred (e.g. southern distribution of sardine)

#### **e.g. Snow crab**

- Smaller size and incomplete spatial overlap of mature female with commercial-size males  
(their spatial distribution change more than that of large males)

### ■ Regimen shift in climate and physical oceanography

- seawater temperature changes was the common proxy

## What is the importance and implications of this process ?

## Ecosystem

- Biological indices (species highly sensitive to low-frequency climate events and can be regarded as integrator of environmental variables)
- Global synchrony
  - Formerly: Benguela sardine out of phase vs Jap.+ Cal.+ Peru sardine (Now simultaneous geo-shifts)
  - Now: out of phase Japanese sardine vs Californian sardine ?
- Ecological consequences: As prey species (e.g. small pelagic fish) of large predators

## Fishery management

- [illegible]

# Sardine return to the north part of California Current ecosystem

*versus*

Sardine recovered in the north part of California Current ecosystem as a result of a conservative management policy

*versus*

## Conclusion/ Recommendation

It is time for a reappraisal of the dynamics of fish populations on the regime time scale, **incorporating spatial processes** into fishery modelling to improve our understanding of the effects of low-frequency climate change on the distribution, abundance, and production of fish populations in the large ecosystems.

Thank you
