Systematic distortions in world fisheries catch trends

Reg Watson* & Daniel Pauly*

* Fisheries Centre, 2204 Main Mall, University of British Columbia, Vancouver, British Columbia V6T 1Z4, Canada

Over 75% of the world marine fisheries catch (over 80 million tonnes per year) is sold on international markets, in contrast to other food commodities (such as rice)^{1,2}. At present, only one institution, the Food and Agriculture Organization of the United Nations (FAO) maintains global fisheries statistics. As an intergovernmental organization, however, FAO must generally rely on the statistics provided by member countries, even if it is doubtful that these correspond to reality. Here we show that misreporting by countries with large fisheries, combined with the large and widely fluctuating catch of species such as the Peruvian anchoveta, can cause globally spurious trends. Such trends influence unwise investment decisions by firms in the fishing sector and by banks, and prevent the effective management of international fisheries.

World fisheries catches have greatly increased since 1950, when the FAO of the United Nations began reporting global figures³. The reported catch increases were greatest in the 1960s, when the traditional fishing grounds of the North Atlantic and North Pacific became fully exploited, and new fisheries opened at lower latitudes

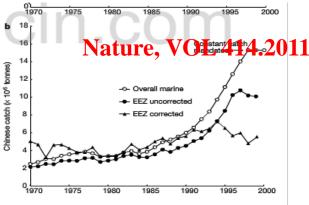

Figure 1 Time series of global and Chinese marine fisheries catches (1950 to present). **a**, Global reported catch, with and without the highly variable Peruvian anchoveta. Uncorrected figures are from FAO (ref. 3); corrected values were obtained by replacing FAO figures by estimates from **b**. The response to the 1982–83 El Niño/Southern Oscillation (ENSO) is not visible as anchoveta biomass levels, and hence catches were still very low from the effect of the previous ENSO in 1972 (ref. 4). **b**, Reported Chinese catches (from China's exclusive economic zone (EE2) and distant water fisheries) increased exponentially from the mid-1980s to 1998, when the 'zero-growth policy' was introduced. The corrected values for the Chinese EEZ were estimated from the general linear model described in the Methods section.

Over-reported China coastal fisheries;

✓ Under-reported China distant-water fisheries;

Abstract

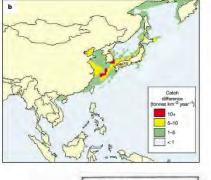

We conservatively estimate the distant-water fleet eatch of the People's Republic of Chinas for 2000-2011, using a newly assembled database of reported occurrence of Chinese fishing vessels in various parts of the world and information on the annual catch by vessel type. Given the unreliability of official statistics, uncertainty of results was estimated through a regionally stratified Monte Carlo approach, which documents the presence and number of Chinese vessels in Exclusive Economic Zones and then multiplies these by the expected annual eatch per vessel. We find that China, which over-reports its domestic catch automatinally under-report prior central distribution, 3.4–6.1 million types⁻¹/₁ (9 m 2000 more rempined with an average of 368 00000000⁻¹ reported by China to FAO), corresponds to an exvessed **Zoneb The Herberg Constant water** fleets extract the argent catch are at the a thread of the analysis of the statement of the argent of the argen

waters (3.1 million t year⁻¹, 95% central distribution. 2.0–4.4 million t), followed by Asia (1.0 million t year⁻¹, 0.56–1.5 million t). Oceania (198 000 t year⁻¹, 144 000–262 000 t). Central and South America (182 000 t year⁻¹, 94 000– 299 000 t) and Antarctica (48 000 t year⁻¹, 8 000–129 000 t). The uncertainty of these estimates is relatively high, but several sources of inaccuracy could not be fully resolved given the constraints inherent in the underlying data and method, which also prevented us from distinguishing between legal and illegal catch.

MISUNDERSTANDING Positive OR Negative

Towards sustainability in world fisheries

Daniel Pauly, Villy Christensen, Sylvie Guénette, Tony J. Pitcher, U. Rashid Sumaila, Carl J. Walters, R. Watson & Dirk Zeller

By Justi

China's economy and population are growing rapidly. As their population increases, so does the demand for food. Feeding 1.3 billion people is no small feat, so being resourceful is essential; China has started looking everywhere possible for food, including the world's oceans, lakes, and rivers. Can a country so large remain resourceful and sustainable in its search to find enough seafood to support its people? The answer to this question will have worldwide ramifications, as most major oceanic fisheries are in decline and may not be able to withstand increased fishing pressure.

- China consumes about 30% world fishmeal and produce about 60% aquaculture production;
- China aquaculture provides food for the world and then reduces the demand on wild fisheries;

http://www.fao.org/docrep/016/i2727e/i2727e.pdf

What are current and expected ecosystem impacts?

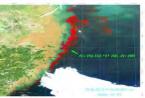

Stresses on the marine fisheries

- The main:
 - Overfishing
 - Reclamation
 - Pollution
 - Climate Change
 - Ecological disasters

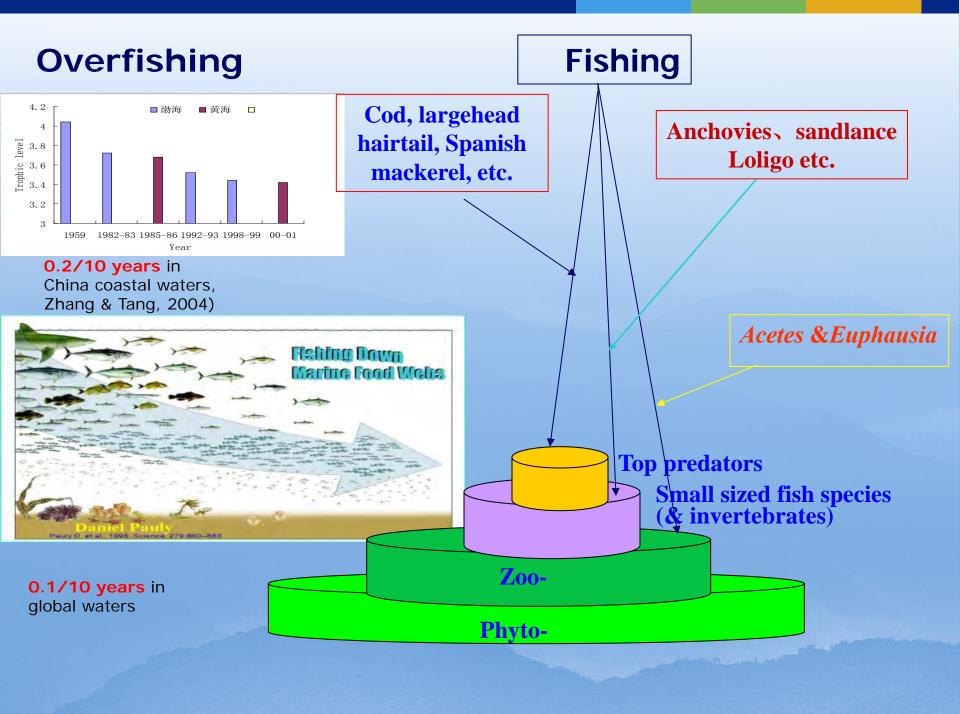

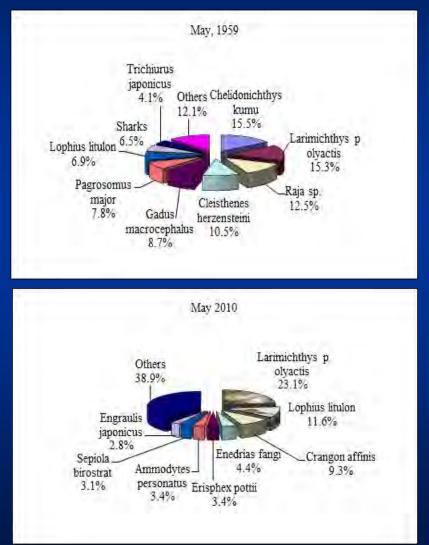

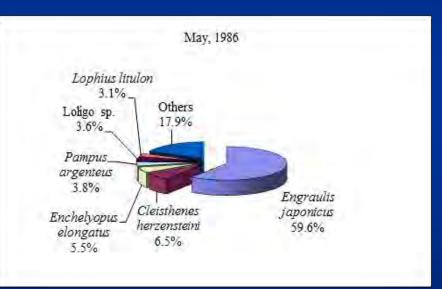

Sharp decline in important fish stock Increasing ratio of low-valued species

Variations in biological parameters of small yellow croaker

Biological parameters	1960	1985	1998	2008	
Growth coefficient k	0.26	0.4	0. <u>48</u>	0.56	
Zero-length age t_0	-0.58	-0.37	-0.3	-0.25	
Asymptotic length L_{∞} /cm	34.21	-30.17	25.54	-24.06	
Inflexion age of body weight growth t r	3.78	2.44	1.99	1.61	
Total mortality coefficient Z	0.51	1.80	2.84	2.89	
Natural mortality coefficient M	0.24	0.33	0.39	0.43	
Fishing mortality coefficient F	0.27	1.47	2.45	2.46

China coastal fisheries

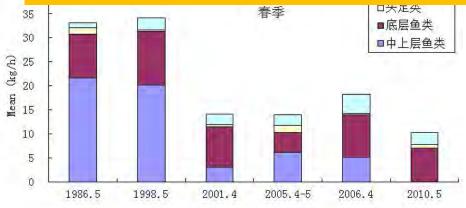

To restock and conserve fishery stocks is needed in coastal fisheries

omically eted due nditions

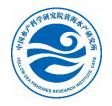

- The community structure changed considerably.
- The large-sized demersal species have been replaced by the low-valued and small-sized pelagic fish, early maturity.
- Changes in food web and food chain.

What mitigation actions are in the fisheries

management?

Ministry of Agriculture & China Coast Guard

Management measures	Year of issue
Closed season/areas	Since 1950's in limited areas;
	Trawling was banned from 1988 in whole
	Bohai Sea;
	Two or three months closed season were
	issued from 1995 in Bohai Sea, Yellow Sea
	and East China Sea, and from 1998 in
	South China Sea
Fishery genetic resource protection	2007 Summer ban fishing
area system	K → ★ # ★ #
The fishing license system	1979
Limits of catchable size and the	2000
proportion of juveniles in the catch	度 / / / / /
Environmental fee system for stock	2000 1 June to 16 Sept.
protection and enhancement activities	
Control fishing capacity	1987
The fishing vessel scrapping program	2003
Reduce fuel subsidies-(40%-2019)	2015 高海 Since 1995,China has launched summer ban fishing, involving 11 marine
*****	provinces, 110,000 fishing vessels and 1 million fishermen.

Mitigation measures

National fishery stock enhancement programs

 Stock enhancement was carried out in China since the 1980s. 国务院关于印发中国水生生物 资源养护行动纲要的通知

国发 [2006] 9 号

各省、自治区、直辖市人民政府,国务院各部委、各直属机构: 现将农业部会同有关部门和单位制定的《中国水生生物资源养护行动 纲要》印发给你们,请结合实际,认真贯彻执行。

> 国务院 二〇〇六年二月十四日

In 2006, The State
 Council of China launched
 "Conservation Action
 Plans for Aquatic Living
 Resources".

Stock enhancement

National fishery stock enhancement programs

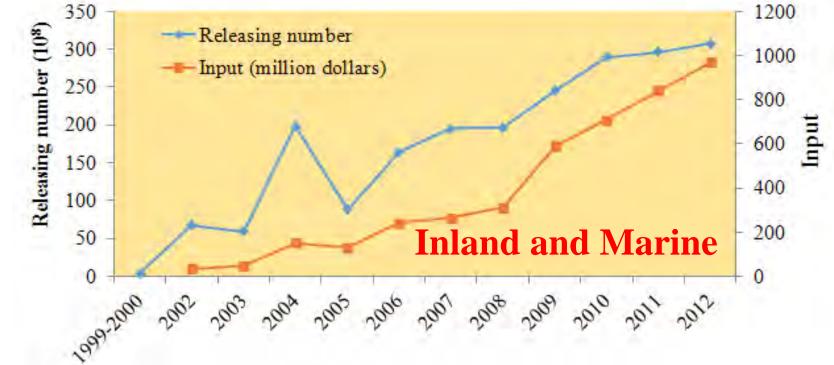

In 2010, The Ministry of Agriculture promulgated "National **Programs of Stock Enhancement (2011-2015)**", releasing number of commercial fishery species will reach to 25.3 billion by 2015.

Stock enhancement

- More than 100 species of fish, shrimp, mollusca and other species with economic value were released.;
- The total number of animals released was 30.07 billion;

Total investment on release was 970 million Yuan (RMB).

Releasing fishery species in Northern China Sea

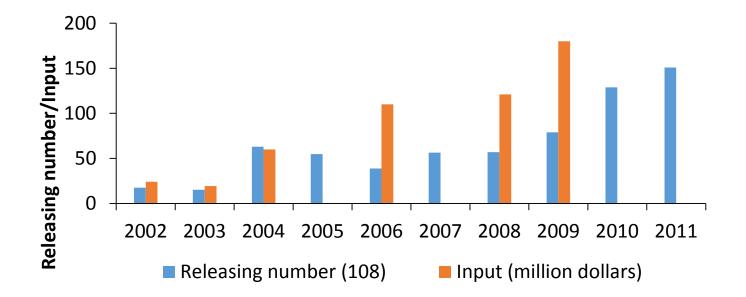

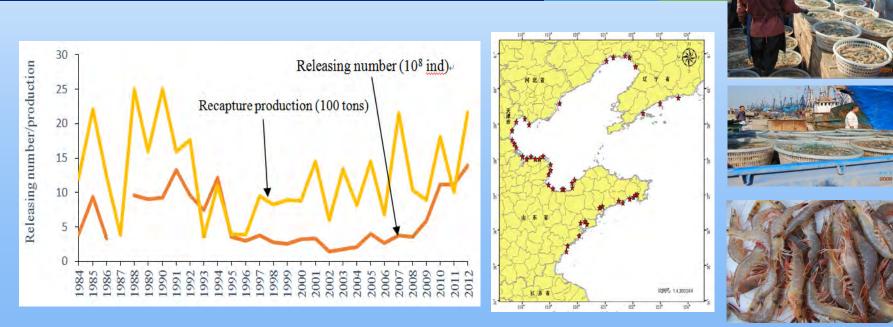

Marine stock enhancement

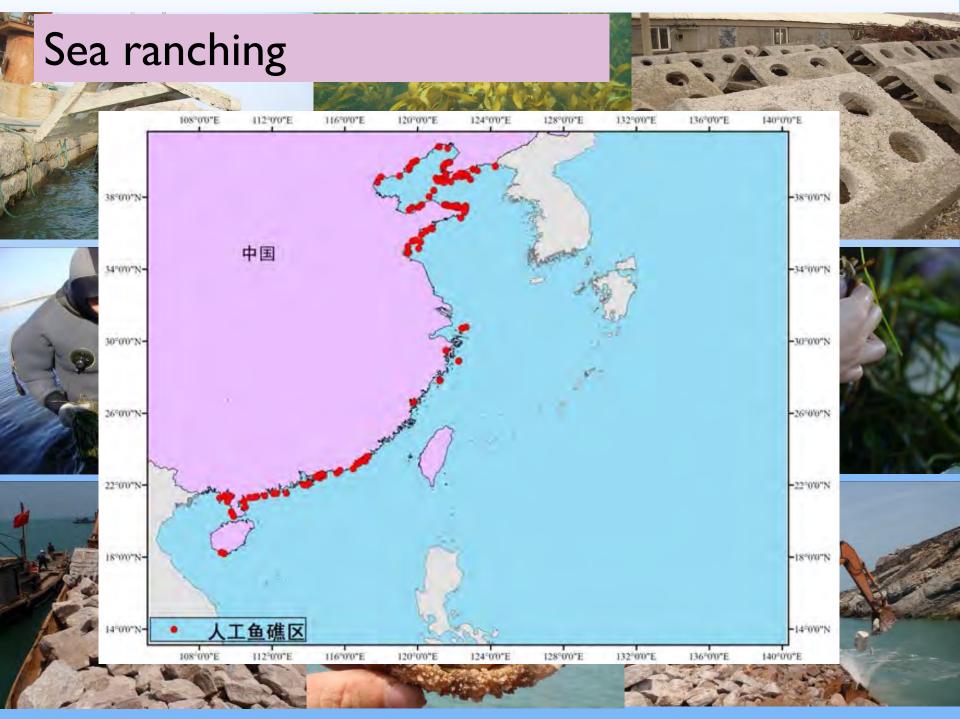

A case of Chinese shrimp stock enhancement

Year	Fishing vessels (ind)	Production (tons)	Production value (10000 RMB)
2010	4 844	1 686	28 053
2011	4 938	1 009	17 908
2012	4 896	2 163	35 194
Average	4 893	1 619	27 052

Releasing number, catch, and production value of Chinese shrimp *Fenneropenaeus chinensis* from the 1980s to 2012 (Southern waters of Shandong Penisula ,From Qiu, 2014)

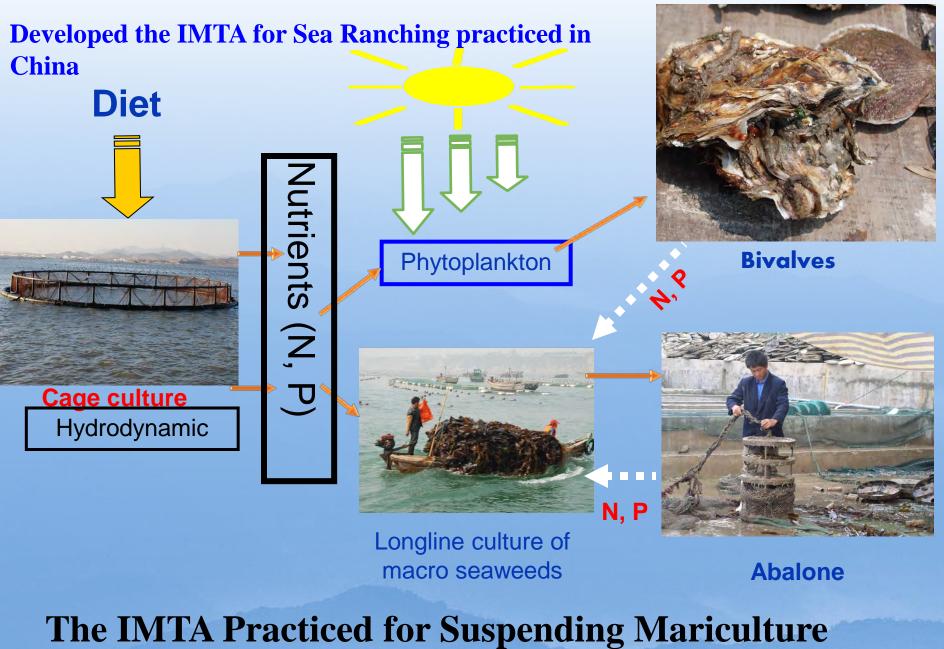

Mitigation measures

Integrated multi-trophic aquaculture (IMTA)

in Sungo Bay, China

From Fang, J

IMTA-Mitigation measures

"In the penultimate chapter on the Yellow Sea LME, Professor Qisheng Tang and Dr. Jianguang Fang review the variable states of productivity and biomass yields under the influence of climate change and anthropogenic forcing. The IMTA technology includes the production of algae (kelp), mollusks (abalone) bivalves (bay scallop), and echinoderms (sea cucumber) to help close the fisheries protein gap, while capture fisheries recover to sustainable levels. Preliminary results suggest that the IMTA pilot should be expanded throughout the YSLME and into other Asian LMEs, where applications could provide job opportunities and food security. **The pilot IMTA project proved to be highly energy efficient and optimized the carrying capacity of coastal embayment while improving water quality, increasing protein yields, and, through carbon capture, contributing to mitigation of the effects of climate change.**" **Dr. K. Sherman, NOAA, 2012**

Sanggou Bay: FISH+KELP+SHELLFISH

From Fang, J

Some challenges in China fisheries

- 1. Social and economic issues
 - Increasing demand on aquatic products
 - Fast development of mariculture area along coastal waters

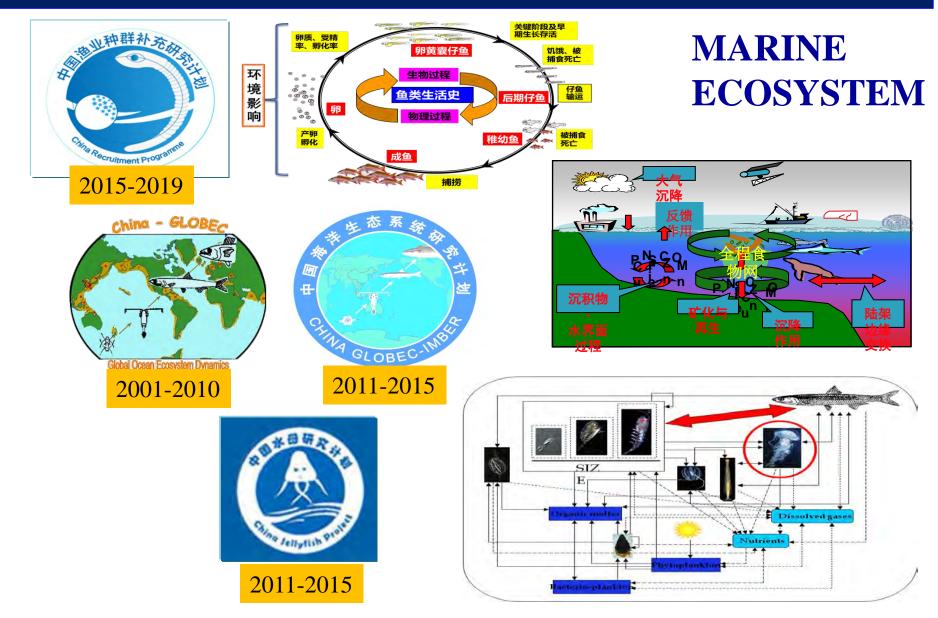

2. Scientific and EBFM issues

- > Overfishing
- > Pollution
- Reclamation

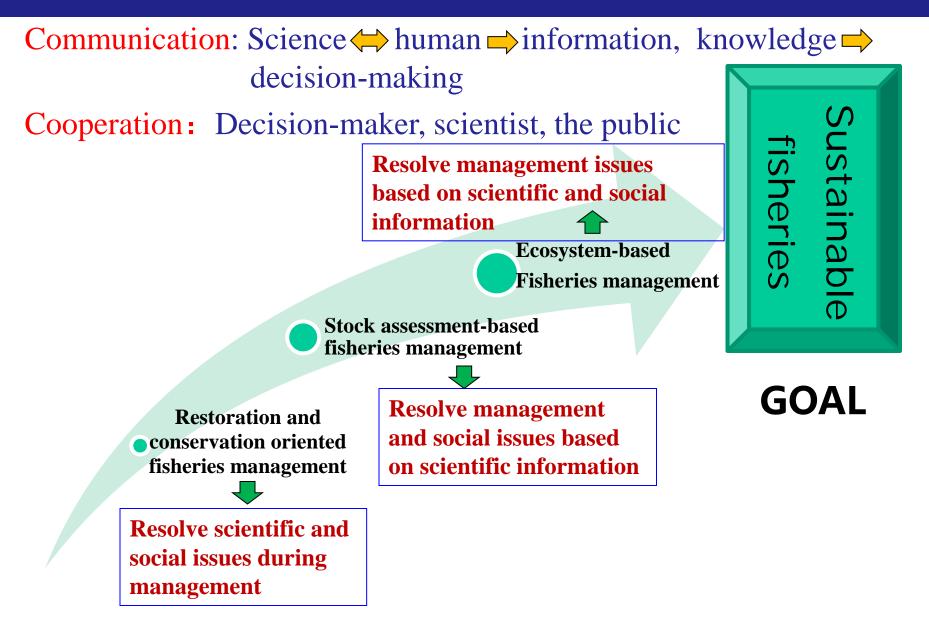

There is no free lunch

Some National Basic Research Programs launched in China

Final remarks

Thank you for your attention!
