The importance of seabirds in Arctic

- conditions on land: very harsh, deficiency of nutrients
- inhabiting two environments ► transport of organic matter from sea to land
- feaces deposition ► guano decay ► ecosystem enrichment
- nutrient components depending on the birds diet
- plankton-eaters and fish-eatres ► different impact on tundra ecosystem

Stempniewicz L., Błachowiak-Samołyk K., Węsławski J.M. 2007. Impact of climate change on zooplankton communities, seabird populations and arctic terrestrial ecosystem — A scenario. *Deep Sea Research Part II* 54: 2934-2945

Comparison of plankton-eating and fish-eating seabird colonies:

- guano deposition

Impact on:

- physicochemical properties of soil
- tundra vegetation structure

Study area

Hornsund, Spitsbergen
Two different seabird colonies:

PLANKTON-EATING (P)

little auks (*Alle alle*)

Ariekammen

FISH-EATING (F)

Brünich's guilemots
(*Uria lomvia*)

Gnålberget

black-legged kittiwakes
(*Rissa tridactyla*)

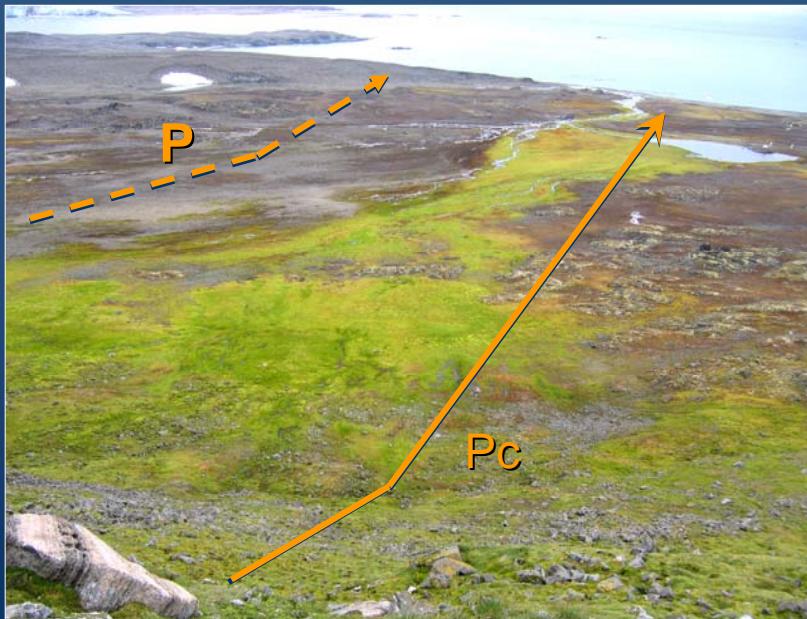

Methods

2 proper transects + 2 control transects

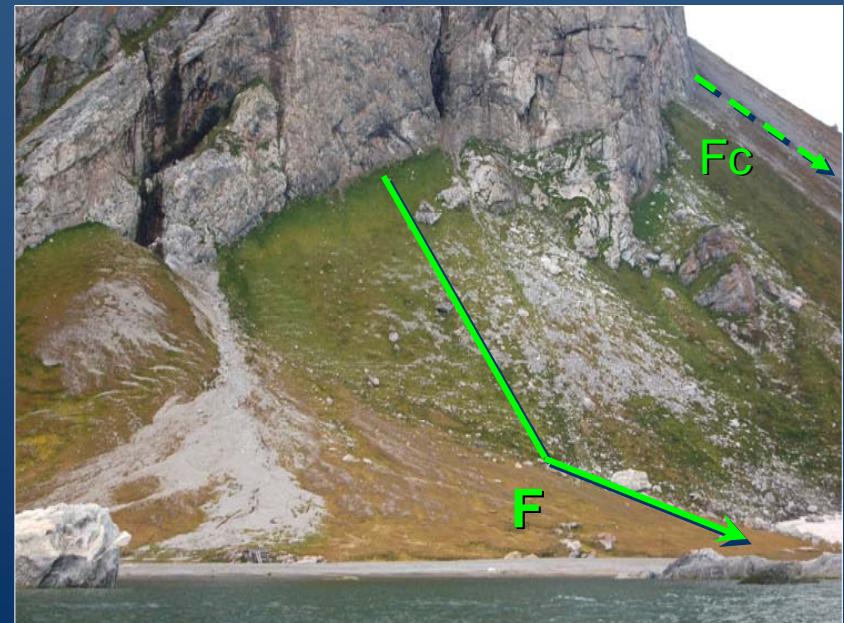

Each contains:

- 10-12 sample plots (160×160 cm)
- 10-12 plastic sheets (150×150 cm)

Plankton-eaters (**P**) + control (Pc)

Fish-eaters (**F**) + control (Fc)

Collecting data

Guano deposition [g·m⁻²·day]
(plastic sheets + computer analysis
with SigmaScan Pro 5.0)

Physicochemical properties of soil:
N, P, K content, conductivity,
pH, dry mass
(3 soil samples per square)

Plant species' cover [%]

Biomass of plants
(5 samples [20×20 cm] per square)

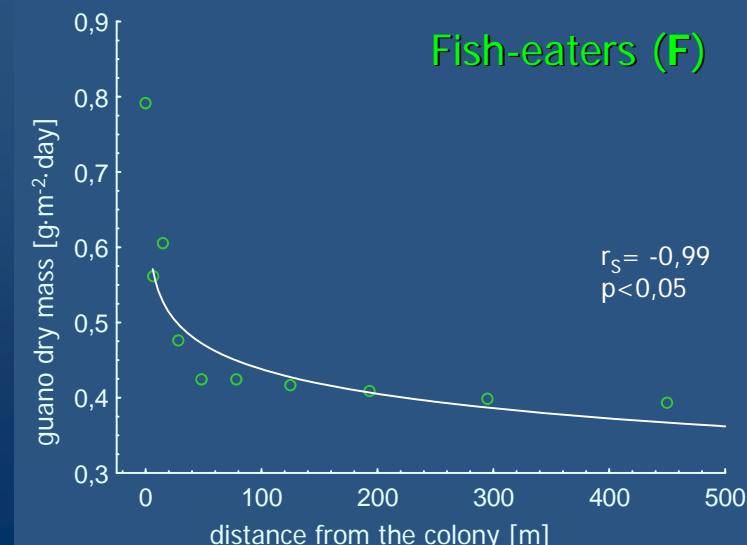

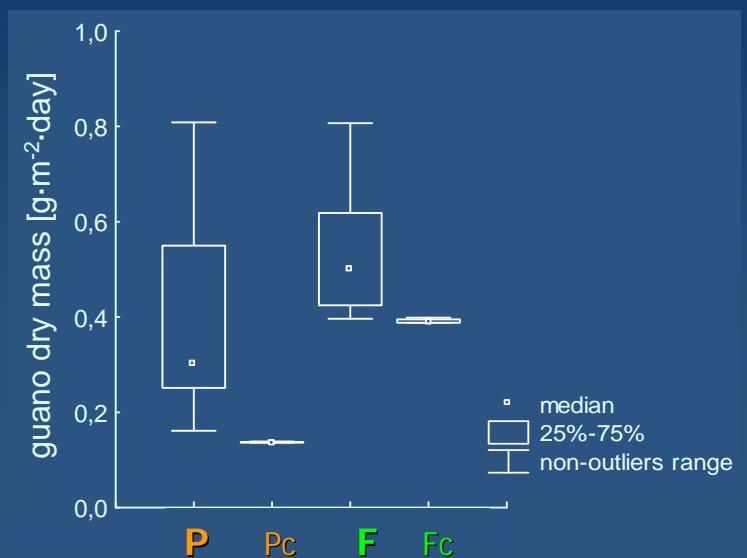

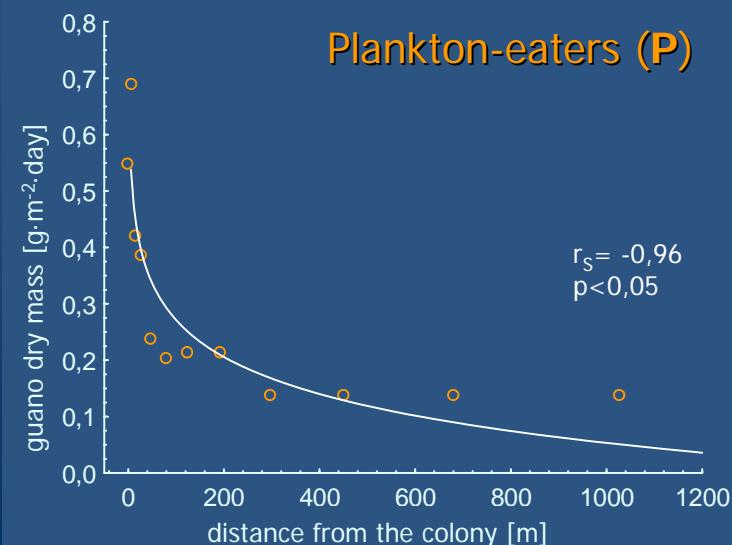

Results

Guano deposition

In plots close to colonies (1 – 6):

- higher amount of guano near both colonies vs. control areas
- higher amount of guano near fish-eaters (**F**) vs. plankton-eaters (**P**)

Strong correlation with distance:

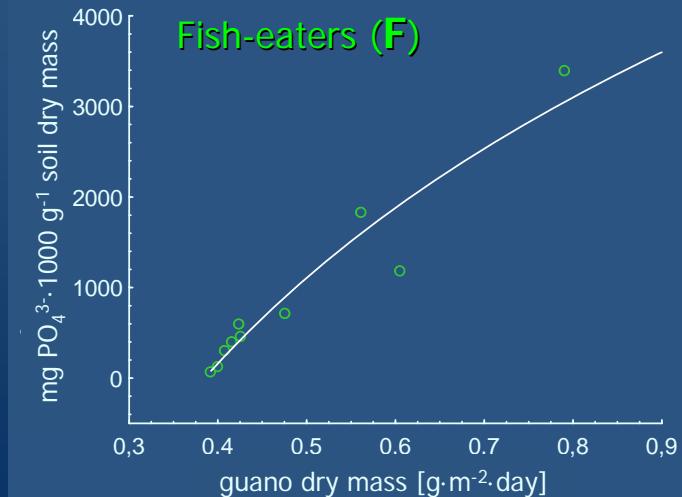

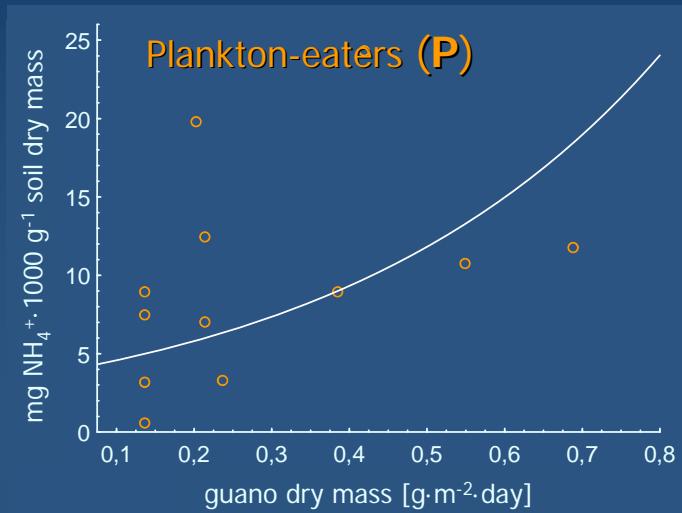

Results

Guano deposition – correlation with soil physicochemical parameters

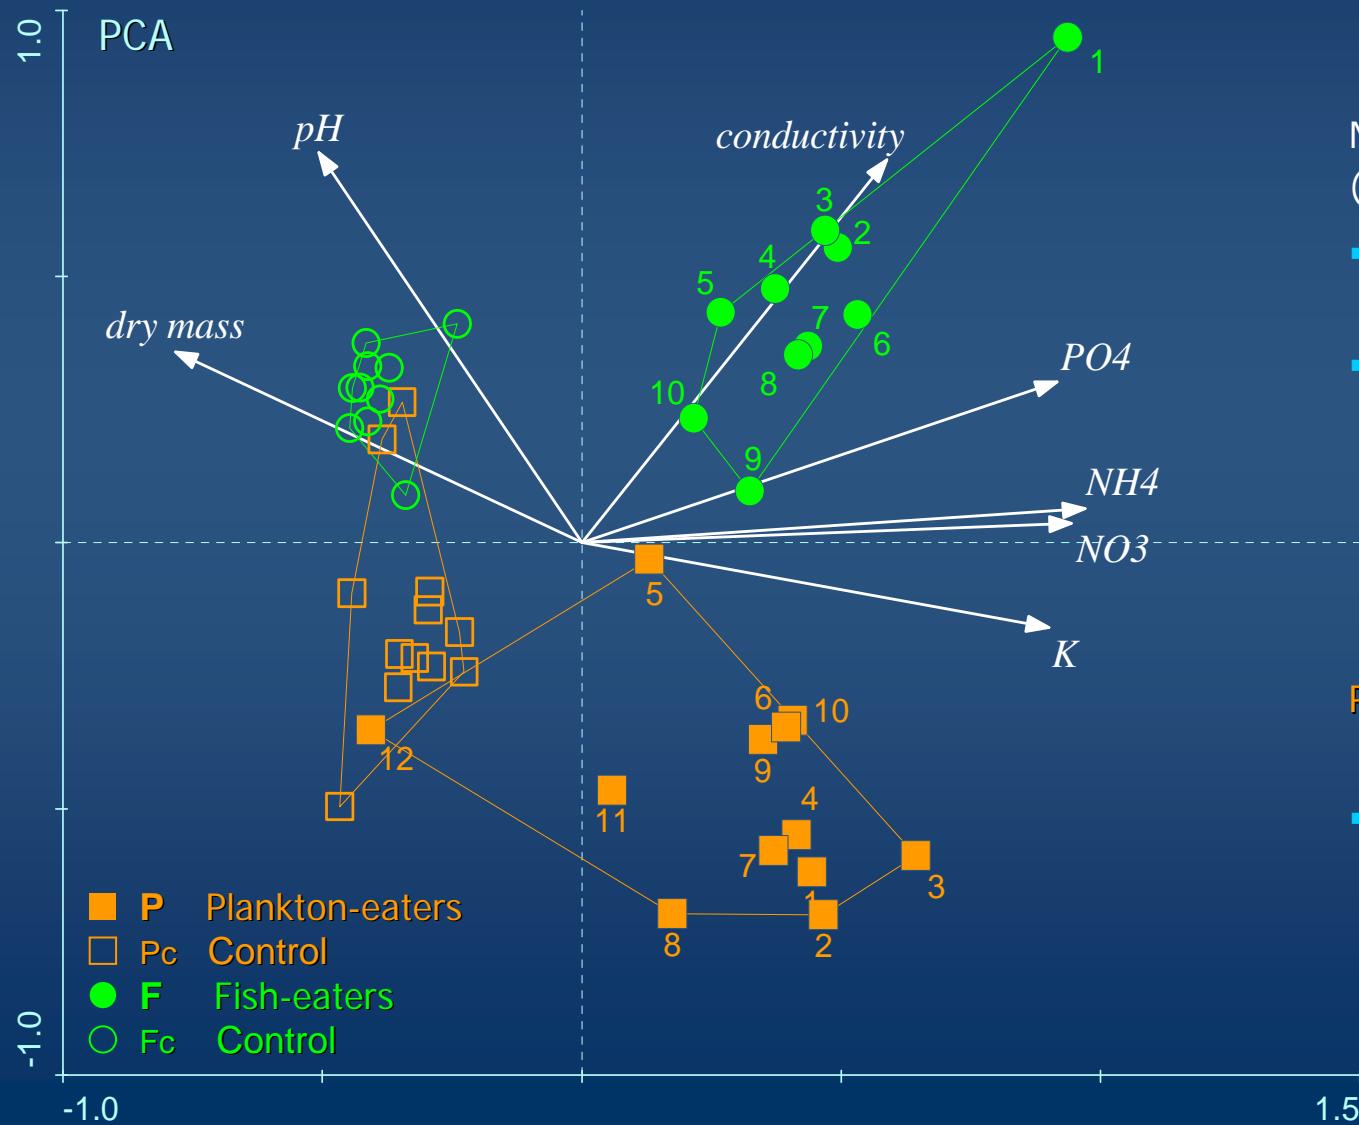

Spearman's coefficient, $p < 0,05$

	P	Pc	F	Fc
NH ₄ ⁺	0,61	ns	ns	ns
NO ₃ ⁻	0,64	-0,67	0,85	ns
K ⁺	ns	ns	0,67	ns
PO ₄ ³⁻	ns	ns	0,98	-0,82
conductivity [mS·cm ⁻¹]	0,86	ns	0,75	0,89
pH	-0,71	ns	-0,66	ns
soil dry mass [%]	ns	ns	0,87	ns

Results

Physicochemical parameters of soil – sample plots ordination

Near both seabird colonies (P and F) vs. controls (...):

- higher nutrient content and lower pH
- higher variability of soil parameters

Plankton-eaters' (P)
vs. Fish-eaters' (F) colonies:

- different soil properties

Results

Soil physicochemical parameters – a comparison

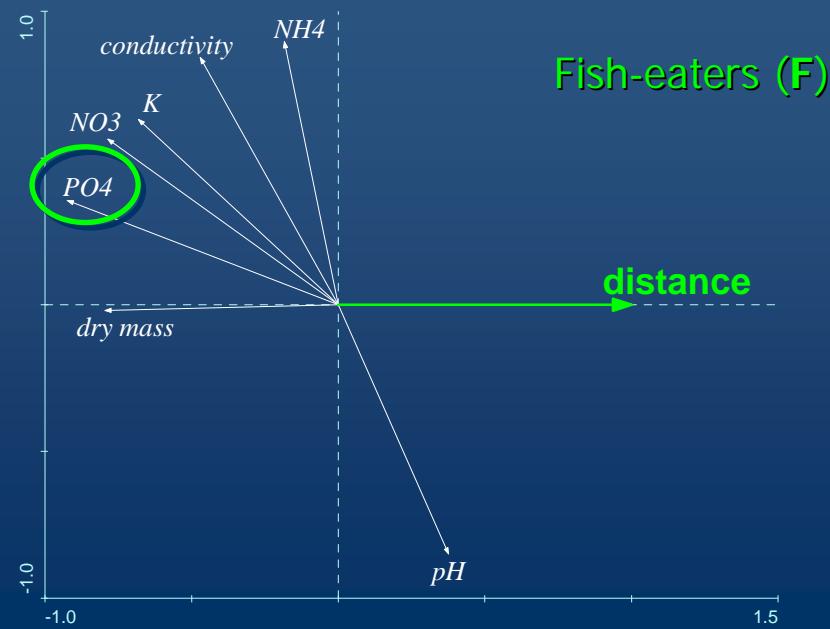

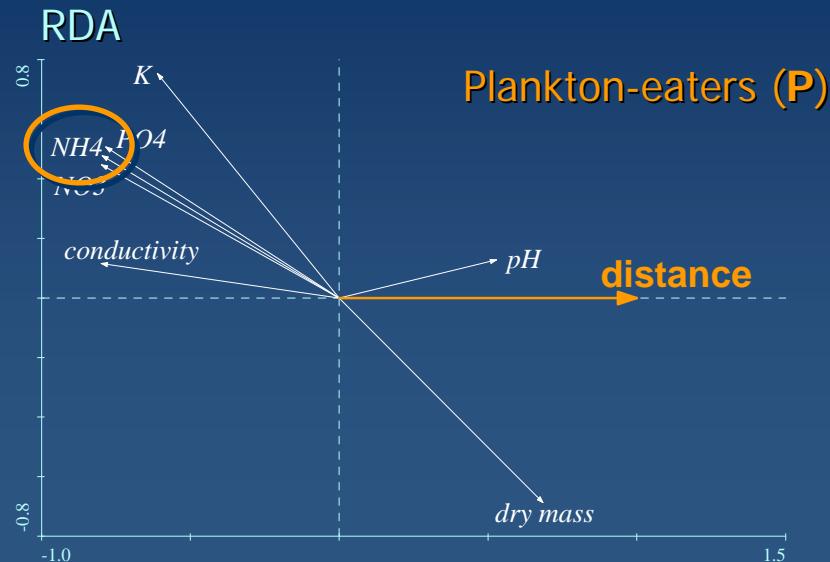

Kruskal-Wallis' test, *post-hoc* Dunn's test ($p < 0,05$)

	$P \leftrightarrow P_c$	$F \leftrightarrow F_c$	$P \leftrightarrow F$	$P_c \leftrightarrow F_c$	Difference between plankton-eaters and fish-eaters:
NH_4^+	>	>	ns	ns	▪ phosphates content
NO_3^-	>	>	ns	ns	
K^+	>	>	ns	ns	
PO_4^{3-}	>	>	<	ns	
pH	<	<	<	<	
conductivity [$\text{mS} \cdot \text{cm}^{-1}$]	>	>	<	<	
soil dry mass [%]	<	<	>	ns	

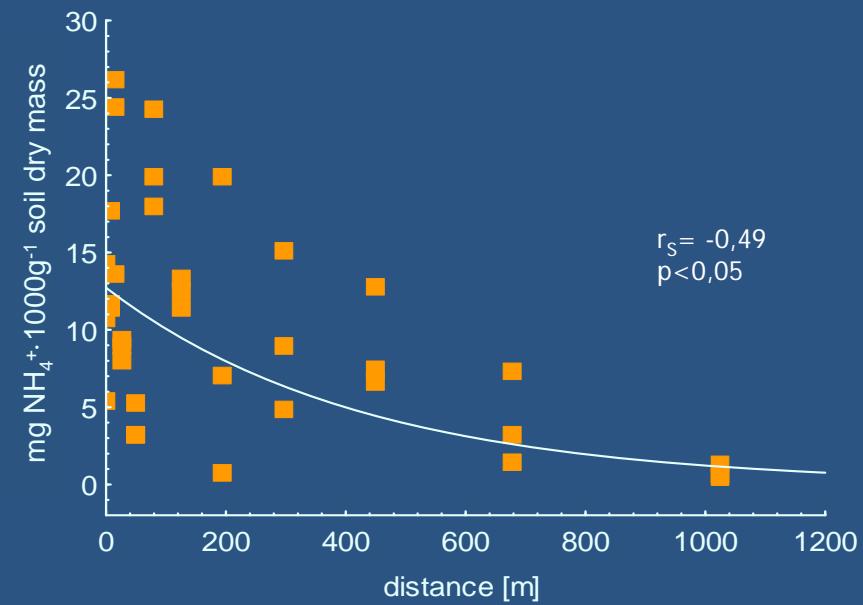

P Plankton-eaters
Pc Control
F Fish-eaters
Fc Control

Results

Gradient of soil physicochemical parameters

	variability [%]	MonteCarlo [F]	p
P	52,2	10,9	0,006
Pc	---	---	ns
F	42,2	5,9	0,032
Fc	---	---	ns

Results

Vegetation classification (TwinSpan)

Cerastium arcticum

- distinguishes transects near both seabird colonies (**P** and **F**)
- distinguishes plankton-eaters (**P**)

Cochlearia groenlandica

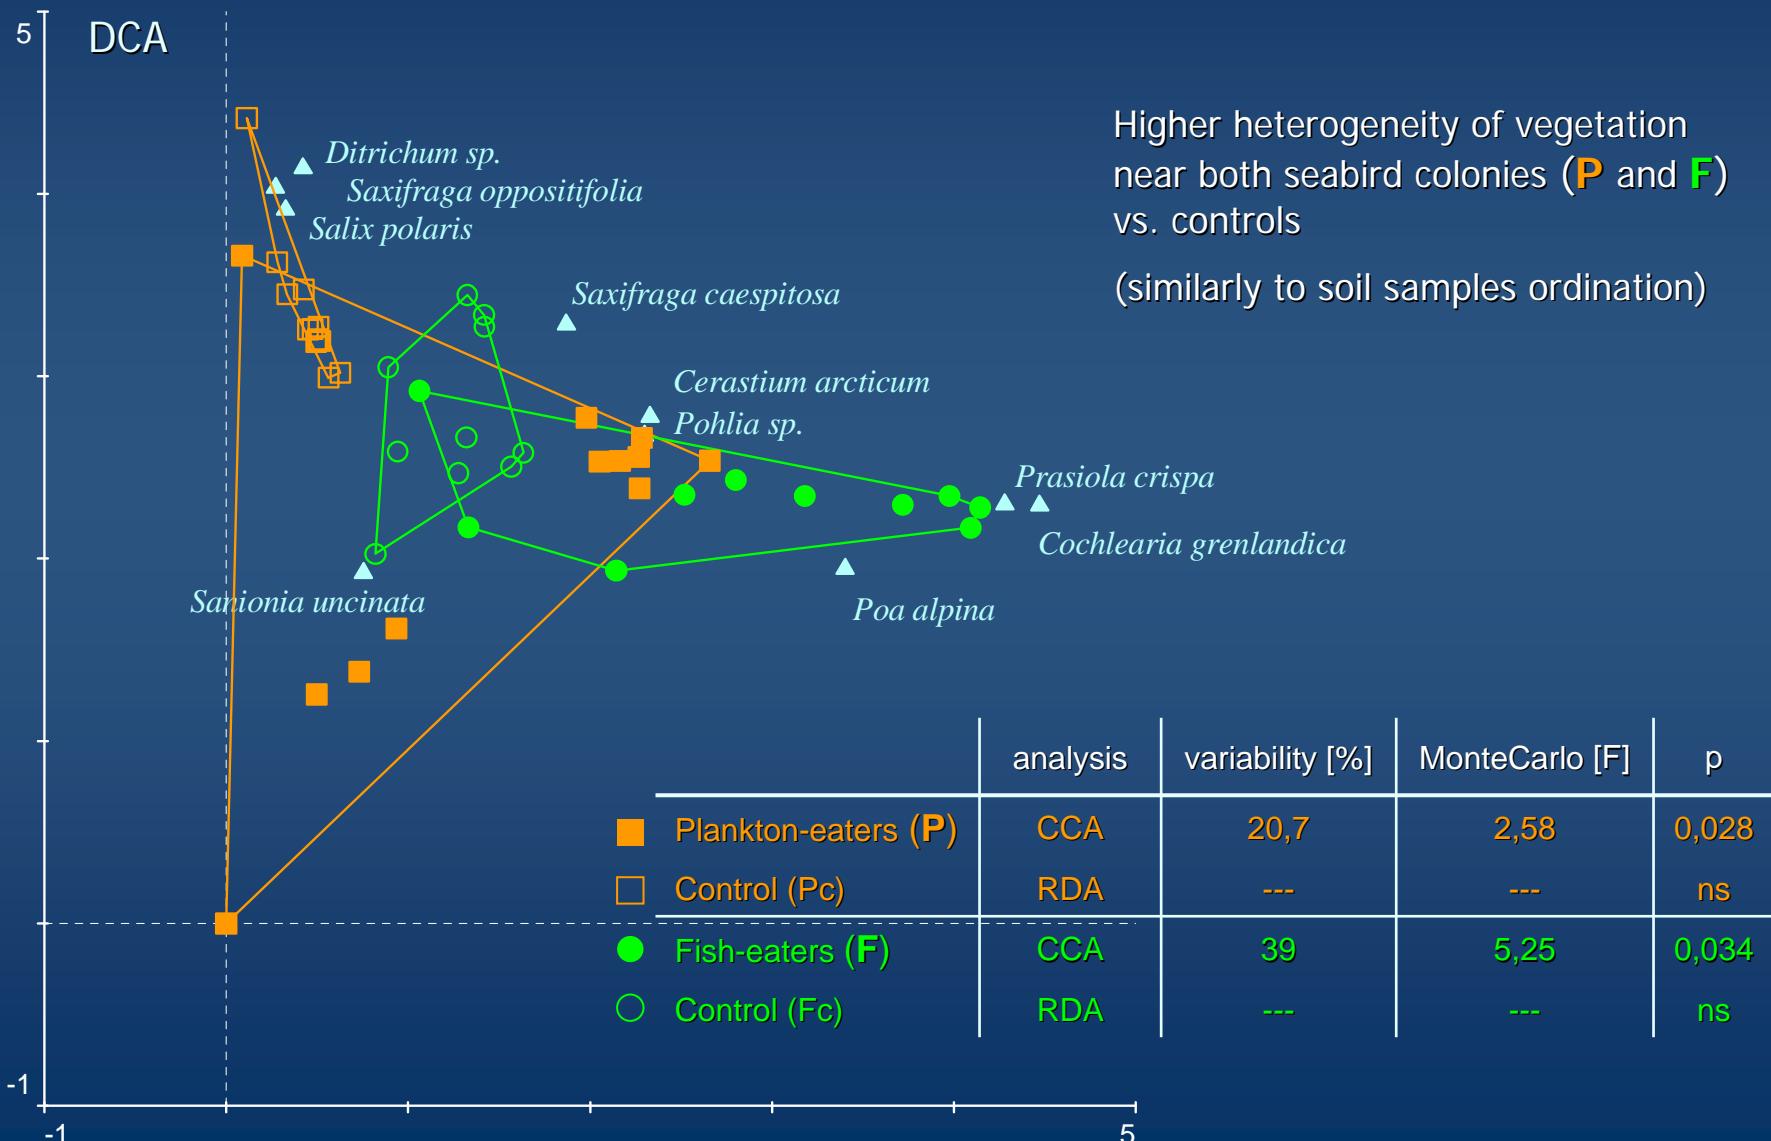

- distinguishes fish-eaters (**F**)

 **P** Plankton-eaters
 **Pc** Control

 **F** Fish-eaters
 **Fc** Control

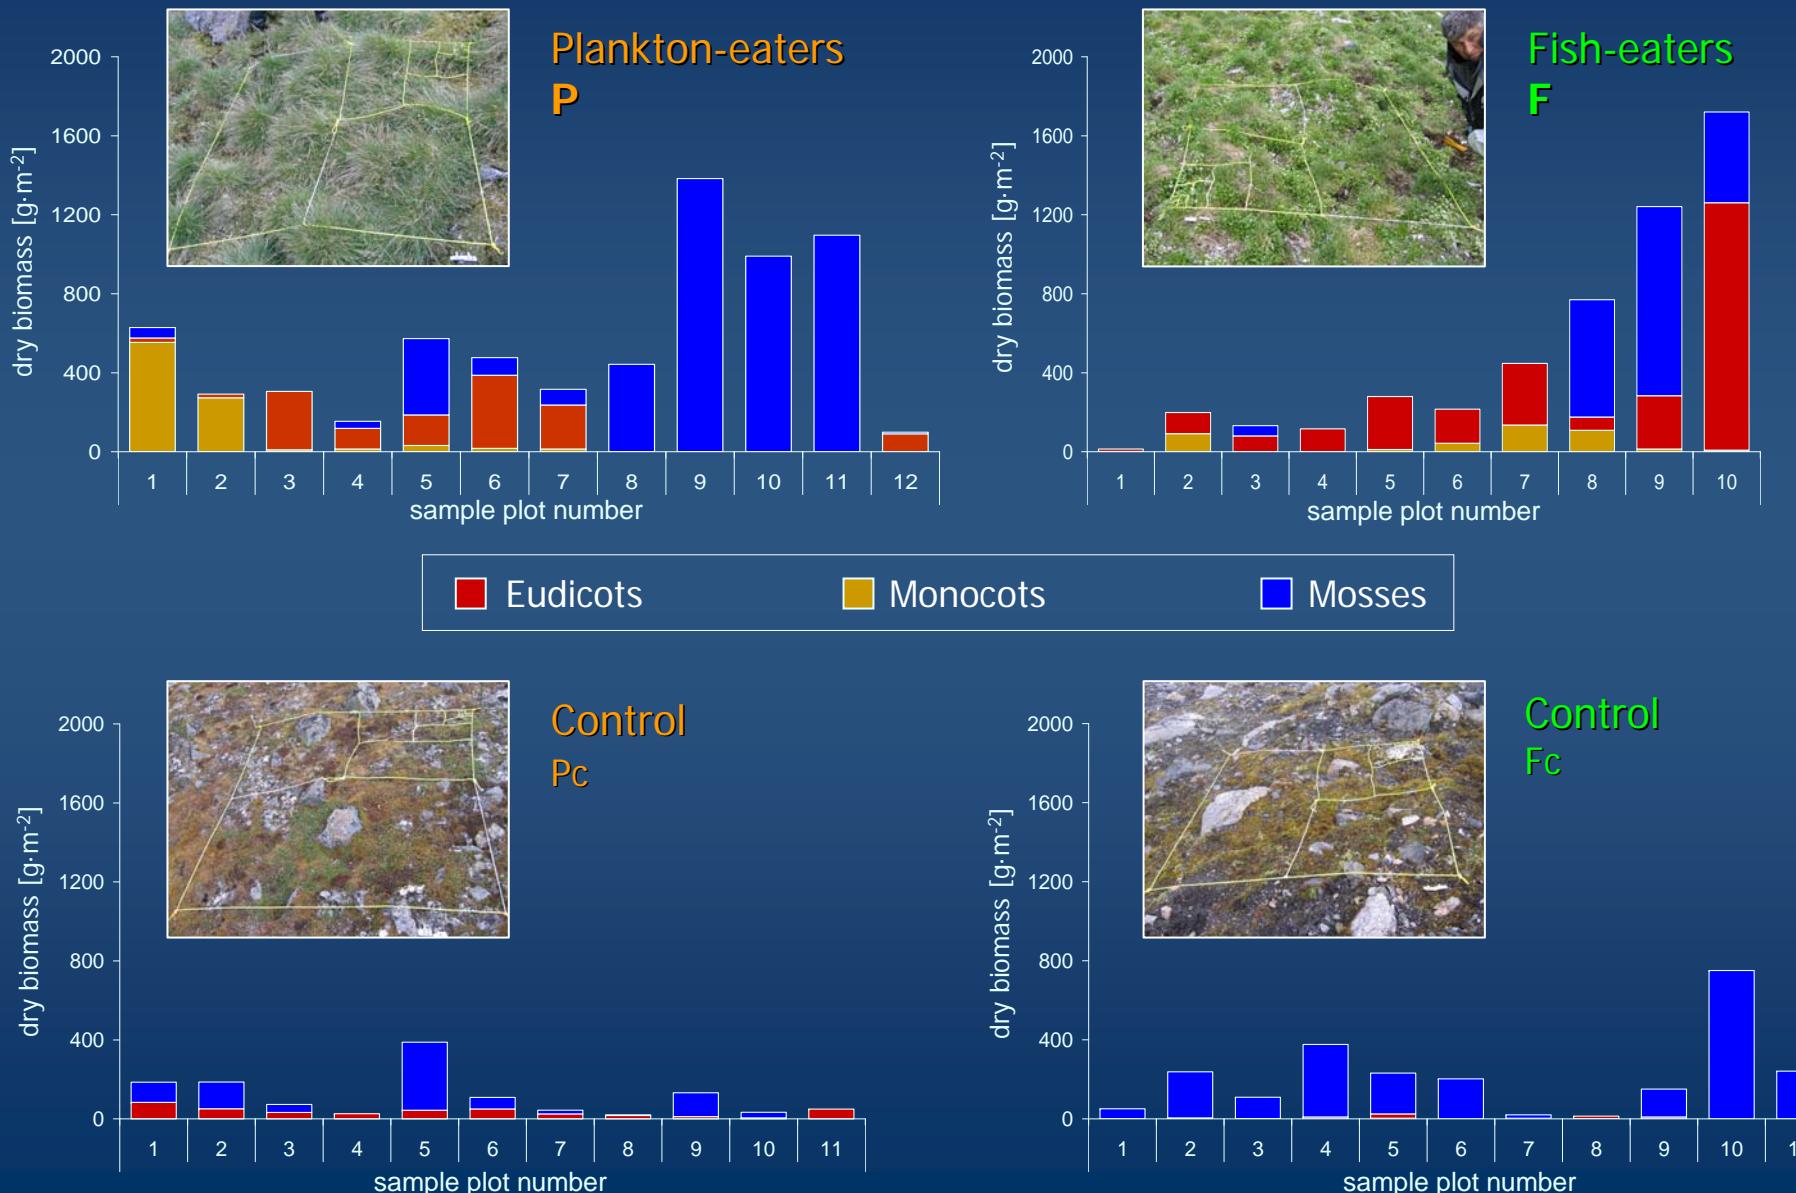

Results

Plant species composition – sample plots ordination

Results

Vegetation biomass

Summary

Vicinity of seabird colonies:

- higher guano deposition
- higher soil ion's content: NO_3^- , NH_4^+ , PO_4^{3-} , K^+ and lower pH
- gradual decrease of soil nutrient contents along the colony-sea axis
- higher heterogeneity of tundra plant communities
- *Cerastium arcticum* discriminating ornithogenic tundra plant communities
- higher biomass of plants

Summary

Fish-eaters' colony:

- higher guano deposition
- higher content of phosphates
- dominance of *Cochlearia groenlandica*

Plankton-eaters' colony:

- higher biomass of vascular plants, particularly grasses
- dominance of *Cerastium arcticum*

Thank you
